Yep, the lid has a safety interlock switch, which prohibits power being applied while the lid is open, and exposing lethal high voltage to an unqualified snooper.
Usually the first things to check after equipment has been idle for a period of time is the power supply filter capacitors. While you're in the vicinity, check the rectifiers too... just in case a leaky filter capacitor took one or more of them out. Either will eat fuses as fast as you put them in.

The Elecraft rigs are kinda the Cadillacs of the QRP crowd nowadays,
very nicely reviewed in QST in the past year or two.

I recently built a Ten-Tec QRP kit transceiver. Main thing I can tell
you is parts for rigs nowadays are way, way, way smaller than the
parts used by rigs like Heathkit in the 50s, 60s and 70s. But if your
eyes are good and your hands are steady and you have the proper tools,
the Elecraft rigs should go together about as well as any other.

Just make sure you have a strong light and an even stronger magnifying
glass :-)

There is no scam. Radio Mart is a legetimate e-Bay reseller
of refurbished ham radio equipment and accessories. There is
no difference between how Radio Mart does business and
other retailers like HRO, AES and others.

The problem here lies with a few usenet knuckleheads and cheap bastard
hams who pontificate about all so much 'sour grapes' over them.
(most or all of em' being ex-hamfest dealers who just don't like e-Bay!)

Something, in perspective, so common of the minority of cheap
ham radio op's we all used to see at the hamfests years ago.
The hams that used to walking around in dirty 10 year old clothes who
never had a good word for anything or anybody so they cast
their bile on that which they could or would not simply walk away from
because the radio on the table was "too expensive" for them. In short
it's cheap-assed cranky old men who act like spoiled 8-year-olds.

If they don't like Radio-Mart you'd think they'd just go buy new
stuff at HRO and AES. R-M has to be doing something right as
it appears each and every auction they put up ends with someone
bidding on something. I say more power to them, and if someone don't
like how they do business, they can go down the street to the next corner
Deli on the block and get a pastrami-on-rye from them instead.

Thanks so much for your advice. Yes, that seems to be the consensus. Elecraft seems to have a great service record and the K-2 is well-designed. I put together 3 Heathkits back in the 70's. the most difficult was a mobile 2M XCVR...seems most like the K-2.

John

Radio-Mart(RM) is a deceptive seller that has cause more than a few
buyers to get negative feedback. I like how the R390A he sells is
Collins "designed", which is not the same as Collins built.

If Radio-Mart(RM) was an honest broker, then there would be no need for
the private sales.

I often see items for sale from Radio-Mart(RM) that I want, but I won't
buy from Mr. Red Velvet. Just wait a bit longer and a better deal will
show up on ebay. There is no need to deal with Radio-Mart(RM).

The "private" sales stem from many folks here contacting his bidders warning them about his supposed questionable character. One or two folks here found his online auctions and started calling him a crook, then many more folks who have never had a single dealing with him joined the bandwagon. Radio-Mart isn't doing anything different than the normal used gear seller... he just doesn't hide his practices as well. Millions of salespeople use these tactics all day long. If true problems develop Ebay will pull his registered status or kick him off, but he's far from being that bad. The situation concerns him, his buyers, and Ebay... everyone else is either jealous, enjoys causing trouble, or can't afford his stuff. If you don't like his practices, then don't bid.

"Radio-Mart isn't doing anything different than the normal used gear
seller... he just doesn't hide his practices as well. Millions of
salespeople use these tactics all day long."

Nice justification. I'll be sure to ignore your advice in the future.

Radio-Mart is into buying radios on Ebay and then turning around and
selling them on Ebay for a higher price and pocketing the difference.
It makes perfict sense to look for radios that are undervalued and then
resell them. I and most other people have no problem with that. The
problem is he does not tell the truth about where he got the radios and
the condition of the radios. I don't understand why he is compelled to
do tell stories about the radios he sells but it does not generally
cross the line into outright fraud and treads around in a grey area so
he will continue to be controversial topic in the news group. Going
"private" will further take his sales into the grey area and apparently
that and the story telling are risks he is willing to take. Buyer
beware.

I have not contacted nor am I aware of anyone else who has contacted
bidders about Radio Mart auctions. They may have read about him on
Usenet, which would eliminate any reason to contact them.

I don't care one way or the other about Radio Mart but people that buy from him should be informed about the way he conducts his business.

Yeah, right! I've been ripped off by that bastard too(along with
numerous others). Claimed the radio was near perfect, found it had been
repainted (not discernable from poor photo) and it smoked after I got it out
of the box. Lets not forget the Shill Bidding he does from his gottahaveit
account!!!!!!! Don't try to defend him, he keeps getting the same negatives
after all these years which shows us, he's still playing the same games with
some defective gear and covering himself with the "Private Sales".

I would like to buy the 146.20 / 146.80 pair of crystals
for a Heath HW-202.

The xtals are probably the standard used in many rigs (rcvr has
10.7 Mc IF; xmtr mutiplication factor is x24).

Message-ID: <4ubuf.46564$ih5.40755@dukeread11>
Source record: 11748

I have a Yaesu FT-102 HF Transceiver for sale. This one was Malcomized by Mal, NC4L in March of 1997. It has had all of the relays replaced plus other upgrades performed by Mal. It has a CW Filter but no AM/FM Board. Cosmetically it is in good but not mint shape. The cabinet looks good and the front panel is nice. There are some small nicks and scratches mainly on the
trim around the outside of the front panel. It works but has problems. On bands above 20
meters, sensitivity is low as is power output. It loads up to over 100 watts on 20. On 40 meters the VFO does not change frequency. One meter lamp is burned out. Price is $375 plus shipping. No mic or manual. Thanks, Charlie Hugg, K5MBX

Trust me, I don't bid on Radio-Mart (RM) gear. Long before I knew he
was a crook, I saw a radio he had for sale that I wanted to bid. The
private sales turned me off. My thought was what does this asshole have
to hide? The private sales are the perfect way to do shilling.

Let's see your net nazi badge, or shut the heck up. I for one am tired of seeing 25 messages a day from some idiot that perceives a newsgroup violation.

Your name appears nowhere as moderator.

Amazingly enough, in my entire life I have only known one truely unredeemable butthole and his name was Golden as well... First name Ron, any relation?

Get a life!

> The manual (such as it is) is very much lacking in this area.

k8vf-

This is an interesting question. I thought the AT-250 was so old it
couldn't possibly be auto-sensing. I found a portion of the manual at
www.mods.dk, and agree that it isn't clear about it.

A box called "TUNE switch" says to tune the antenna and then turn the TUNE
Switch off. It also says that after tuning is complete, the motor may
activate during operation if you leave the TUNE switch ON. This suggests
that it does have auto-sensing of a sort.

HOWEVER, the "CAUTION" on the first page, repeated on the last page of the
manual, says you MUST limit power to less than 50 watts when tuning is
initiated. When not tuned, voltages inside can be extremely high, and
could cause damage to the transceiver. I suspect damage from arcing could
occur inside the tuner as well.

Therefore, even if it has auto-sensing capability, it is not good practice
to routinely rely on that alone unless there is some way to limit power.

Nowhere in the manual could I find a hookup with no control cable
connected. Operating it that way would be at the user's risk.

I am looking for any suggestions as to reliable inexpensive electronic weather instruments.

With several units that I have tested from places like Target, Walmart, Radio Shack I find that they are not repeatable, readings drift and will die when the weather gets cold.

Has anyone found a source or brand that they have had good success with?

Any leads or links to building your own instrumentation?

Thanks

TMT

Radio Specialty Model 1179-22-1 Repeater------------------$ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed, but inside is very clean!
Repeater is in a wall mountable battleship gray cabinet,
that is 4" deep by 13.5" wide, by 21.5" tall, and is
around 30# in weight. It is a VHF base/repeater used by
the BLM out west...
It also has on the front cover, I-5YACC, then under it is
271, under that VHF REPEATER. There are a lot of FCC type
acceptance # all over inside, plus the maker, and maker's
partial address, and part # for transmitter, and receiver
sections.
NO documentation.

1 Comspec TS-32P-----------------------------------NEW----$ 35
New never used in original package complete with tuning
tool, wire jumpers, switch chart for pl tone, and mounting
tape plus original documentation/schematic.

2 Kenwood TR-7950----------------------------------EACH---$ 80
Each comes with mobile mount, and 1st sale gets the
packet adapter. Are in very good shape, but do not include
the TU-79 PL boards which are available at www.piexx.com
They will not come in original box, and if I do not have
the manual, I will photocopy, or pdf one (your choice)...

Standard C468A LNIB--------------------------------------$ 75

LinkXcel PS-141B 4 port KVM Switch with 4 cables----------$ 65
-Like New- This is the PS2/VGA model -No manual-

Pioneer DRM-602X Scsii cd changer that uses Pioneer--------$ 15
audio cd carts. -No manual-

Sanyo SCP5000-------------(Sprint)-9/10---------------BEST OFFER
1 desktop charger
2 AC adapters
2 12v adapters
1 data cord

Samsung SCH3500----------(Sprint)-6/10----------------BEST OFFER
1 extra battery
1 holster

1 desktop charger
1 12v adapter
1 data cord
NO MANUAL or BOX

Nokia 252-----------------(unknown)-8/10-------------BEST OFFER
2 extra batteries
1 holster
1 desktop charger
1 12v adapter
NO MANUAL or BOX

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

Pictures of the radios can be found at;
http://www.mantico.com/4sale.htm
I will have all items on line as soon as possible.

"reliable" and "inexpensive" are at best orthogonal, if not downright
contradictory...

I just want the stuff to work. Had a heathkit weather station for a
number of years, but when I worked 2m packet, it thought I was on
jupiter -- temperatures zoomed down and barometric pressure went
really, really high (and that was *after* I put RF bypassing on a lot
of high Z nodes, and shielded the thing).

I've had no trouble with the Davis Instruments stuff. Currently run
Vantage Pro2 stations at a number of locations, using the Weather
Display software.

It's not cheap, but it works.

No license, no original software CDs....hmmmmm......and somehow it's RT Systems fault? If you cannot produce a license or original CDs, it's your fault and if I were RT Systems, I would think you pirated the stuff and why they won't help you. Best to put originals in a safe place or fireproof vault. It's your fault, not RT Systems.

Been out of Amateur for more than 20 years and would like to know when the Kenwood TM-331A came out and how does it compare to the Alinco DR-235T, both 220 transceivers? I know the Alinco can be modified but there is no info on the mod site re the Kenwood, not that it's important. Which one would you buy and why? All comments & opinions very welcomed. Thank you.

Cordially,

Maybe so, but that has absolutely nothing to do with the newsgroups
you're replying to.
For any message formatting issues you'll have to either bitch to Google
or switch to a normal interface like Netscape mail. Hotmail, Google,
Yahoo and the rest of the free shit is pretty much "you get what you pay
for".

50. FS: Boonton Grid Dip Meter

Newsgroup: rec.radio.amateur.equipment
Date: 2006-01-04 03:24:46 UTC
From: Peter Hiscocks <phiscock@job.ee.ryerson.ca>
Message-ID: <dpff5u$8eo$3@news.ryerson.ca>
Source record: 11786

For Sale: Boonton Model 59 Grid Dip Meter

Seems to be complete and probably works, but it hasn't been powered up since
about 1969. It should be repowered in such a way as to reform the
electrolytic capacitors. Or these capacitors should be replaced.
So I haven't tried powering on the unit myself.

Pictures of this type of instrument can be seen on the web at:
http://oak.cats.ohiou.edu/~postr/bapix/Dip_59.htm
where it is described as:

The Measurements Corporation Model 59 "Megacycle Meter" is arguably one of
the best grid dip meters ever made. Its large meter, separate head, quality
of components, and regulated power supply are part of why this is a
preferred grip dip meter.

The manual for the Model 59 is available on the web at:

ftp://bama.sbc.edu/downloads/boonton/59/
ftp://bama.edebris.com/bama/boonton/59/59mcmtr.djvu

$50 CDN (or best offer) plus shipping FOB Toronto.

58. HELP - Kenwood TM-241A mike repair & disassembly

Newsgroup: rec.radio.amateur.equipment
Date: 2006-01-05 03:47:02 UTC
From: Kevin Hastings <myfamilydotcom@hotmail.com>
Message-ID: <WE0vf.149915$Ph4.4575529@ursa-nb00s0.nbnet.nb.ca>
Source record: 11794

My Kenwood TM-241A 2-meter rig looks brand-new, but its mike has in intermittent PTT switch. A substitute mike from my Kenwood HF rig keys up the radio every time, and sure enough, when the TM-241A mike is failing, the PTT contacts at the mike's wiring terminals are not closing. Rapping the mike will restore the thing for a while, so I've eliminated the wire & plug.

Now for the question - I was hoping to completely disassemble the mike and substitute a new PTT switch (or fix a loose wire, or whatever), but upon inspection, this mike has 2 printed circuit boards, and the swich & wiring in question are sandwiched between the 2 boards. Looks like a lot of posts on the DTMF keypad board actually support the mike circuit board - they are soldered in rows on the mike's circuit board. Do I unsolder all this carefully, or are those posts actually plugged into sockets on the DTMF keypad board (in which case I guess I need to pry them apart which so far doesn;t seem to separate them at all).

So is this a socket I need to pry on harder or do I spend a long time unsoldering this thing? Anybody with experience with this that could guide me thru the process if I get in trouble? I'm OK with fine soldering, but don't want to start that if there's a better way.

Just how high is that horse of yours?

I am neither a dealer or a hamfest tire kicker. I am a collector of sorts. And as a result, I was suckered in by an older Yeasu FT-401 transceiver, "Mint, Restored. I have gone thru this rig and replaced all tubes that needed to replaced, and fitted a new T/R relay."

What I got was a filthy rig in better than average condition, but not mint. The CW filter is non-functioning, the finals were flat(his "new "tubes gave me 10w out on 80m), and the T/R relay is original, not a NOS replacement as he claimed. A bad solder joint in the mixer stage rendered it inoperable until I corrected it.

If you don't think Martin threatens negative feedback, look at his recent feedback to see how many negatives are posted as neutral, or even positve feedbacks. I'm on his "blocked bidders list" because I posted my complaints as negatives, and I can live with that. Ebay would be a safer place if everyone posted negatives that were deserved.

I have the Alinco. Great radio, extended receive (some mil air),
accepts modem board for packet and APRS (GPS input on front face of
radio, RS-232 (DB-9) on rear, also accepts digital board for GMSK
digital audio communications with other GMSK compatible radios (ICOM
Alinco, etc.). Also, alpha tags are nice. I have the 135 for APRS
(N6XQY-12) and the 235 for the California CONDOR system (linked 220MHz
system covering most of CA, some of AZ, NV). Now looking at the dual
bander if I ever need to replace my Kenwood TM-V7A.

Enjoy es 73,

Doug Gavilanes, N6XQY
Garden Grove, CA.

65. Help With Compact Screwdriver Mobile Ant Mt

Newsgroup: rec.radio.amateur.equipment
Date: 2006-01-06 07:37:14 UTC
From: Doug Gavilanes <gavilan1@earthlink.net>
Message-ID: <K6pvf.3682$HI6.1003@newsread3.news.pas.earthlink.net>
Source record: 11601

Greetings from So.Cal.

I'm at wits end, now having gone through 4 antenna mounts on my vehicle. This is the situation: I have a Jeep Wrangler, on the rear of which I have a trail rack (for cargo, and mounting Gerry cans). Over the last few years, the trail rack has become my mobile antenna farm, hosting a Diamond NR770 NMO dual band whip, a 1/2 wave Larsen base loaded NMO 220MHz whip, a 1/2 wave Larsen base loaded NMO 144MHz whip (for APRS), and a Larsen VHF-UHF-800/900MHz NMO center loaded monitor antenna. For HF, I mounted a K400 mount with 3/8" stud for a Lil' Tarheel II compact screwdriver (16" body, plus 5' whip), on the left rear corner of the trail rack (about 6' off of the ground). This location puts the antenna at a high point at the rearmost location on my Jeep. Being a short wheelbase vehicle with a 3" lift and 32" tires, the ride is inherently bouncy. The daily commute on the I-405 in the South Bay of the L.A. basin injects speeds of 5 to 70MPH during the commute. To date, I have cracked the base plate of the trunk lip K400 mount around the front edge of the round protrusion where the adjustable head of the mount supports the antenna. Twice, on separate new K400 mounts. The K400 is too flimsy (the fact that it is being made in China from metal not of the same original stainless grade as the original article is a separate issue) to support the stiff antenna, which is bounced and rocks front to back and side to side on every bump, dip, and pothole. Complicating matters is that the mount is at the rearmost and highest point on the rear of the vehicle, and the momentum of flexation is greatest at this spot. However, it is the absolute best spot to mount the antenna for performance and loading (perfectly flat on all bands 10 through 75M).

My Alinco DX-70T only delivers 100W, and when mobile in motion, doesn't always have enough punch, so I enlisted an amp that would provide me with about 200W PEP, the max. rating of the Tarheel II. The amp exceeded this a few times, and after replacing the coil once, Tarheel informed me that a new compact version was under development, with a max. rating of 500W PEP. Armed with this knowledge, I installed an Ameritron ALS-500M with remote and soon abandoned the K400 and smaller Tarheel II for the heavier duty Tarheel "Stubby" (16" body with 5' whip) and a new Hustler stainless ball mount. Worked great, but within two weeks, upon arriving at my office one day, a co-worker asked me if my antenna had broken. When I went out to check, the antenna had rotated down at a 45ï¿½ angle into a big 6.5' curb feeler mode into the left parking space next to me. I removed the antenna, and found that the outer ball half had cracked at the 3/8" stud that protrudes from it, causing the ball to loosen and slip. The candy store was nice enough to replace the part under warranty, and that night I was back on the air.

A couple of weeks later, I noticed (during my daily mount checks provoked by the paranoia of losing a $350+ antenna on the freeway, and causing an accident, to boot) that some "wiggle" had developed between the 3/8" stud exiting the outer ball half, and the outer ball half itself. Enough movement to make me fear that another 30 or 40 miles would be enough to snap off the antenna cleanly from the replacement ball mount, unexpectedly. I removed the antenna, and searched for a stronger mount. I remember the old Motorola stainless ball mounts from the Broderick Crawford 2150 days, and that they were nearly bullet-proof. I also remembered that Antenna Specialists made them for Motorola (ASP-3, or something like that). These are as rare as $3 bills nowadays, since A/S abandoned making them. However, I collected an ancient Batwing ball mount with a cracked gray phenolic base (too bad, as that's where the Moto branding was) years ago at the swapmeet, so I tore my garage apart and finally located the old gem. I retired the Hustler stainless hardware, and installed the Moto / A/S stainless hardware into the black phenolic Hustler baseplate. Perfect fit, and very tight mount (no slop at all). About three and a half weeks have passed, and I have just discovered the same "wiggle" that caused me to scrap the Hustler ball mount. Needless to say, my screwdriver is again off the air.

Sorry for the preceding "diary" - but a good understanding of my dilemma couldn't hurt. Now, does anyone out there know of a strong 3/8" stud mount that will support my screwdriver (which probably weighs about 8 to 10 pounds, with a 16" body, 2" dia. coil, and 5' whip) now and forever?

I am able to bolt into the 1" square tubes of the trail rack - that's how I affixed the fabricated steel mounting plate that I put on the side of the rack to host the ball mount. The top and bottom tubes are about 4" apart. Can anyone offer a practical solution? My HF capability is important to me (ARES emergency comms and stuff, you know...). Thanks in advance.

Texas Weather Instruments developed the 1-WireT Weather Station, using
technology licensed from Dallas Semiconductor (see Sensors magazine June
1998), to solve the problems of attaching multiple cables, power supplies
and consoles associated with weather instruments to a Windows PC.
http://www.txwx.com/1wire_bro1.htm

AAG Electronica (Mexico) makes the kit of parts ($75), the TWI is only an
assembled unit.

Help with Ameritron AL-82 Amp
I recently got an AL-82
And it needed tubes which I put in today and
It seems to put out full power on all bands except
160??
No power out on 160?? The relay goes on and no tx power comes out?
Any help on what to look for would hel greatly.
Thanks....Rich

Wow, 29 years bootlegging on ham and no FCC check? I think that's a
new record!! There's been a couple of guys on a Militia/Patriot
net every night on 3.8-0 mHz LSB for over 3 years now with phony callsigns
who still ain't got caught or even raised a red flag with either FCC or
OHS.
but if you went along for that long and got off with a slap on da
wrist, then woo-woo on you. (bet you were a good customer at the ham store
also eh? Did the buffoons sel you a big amplifier too with no license
check? prolly did..)

I have one extra Cyfre CA-819 Dual Band cell phone amplifier, some specs below. Just connect to your cel phone (with optional cel phone antenna jack (depends on cell phone model) and boost output and receive - asking $250 shipped (within lower 48)

E-mail me for more info or photos.

CYFRET CA-819 Direct Connect Amplifier
Dual Band Wired Amplifier for all North American 800 MHz & 1900 MHz carrier systems (excluding iDEN Networks)
Features / Benefits
. Increase revenue through customer retention
. Less cell site build out
. Keeps customers connected to utilize the full potential of their phones and network services.
. Carrier friendly in urban areas
. Increases data traffic & data speeds
. Communication only occurs through the RSSI of the handsets
. Requires zero additional bandwidth from cell towers
. Case designed for Zero RF Emissions

CyfreT Amplifiers seamlessly bridges RF amplification between Cell Towers and todays elaborate handsets without disrupting the carrier's tower management Networks. Thus, the entire CyfreT line of amplifiers becomes an integral part of all wireless network solutions.
Network Compatibility
Cyfre'sT creation of the Digital Microprocessor, combined with licensed Motorola patented technology, have achieved compatibility with the following standards.
CDMA 2000, TIA/E-98-A&D, 1xRTT, TIA/EIA-690 Analog (dual-mode), IS-95-A&D, and GSM.

Not me. I would dearly love to find an unbuilt Johnson Ranger II. I would build it just to be able to use it. I wouldn't care what it did to the value. However, if there was one somewhere, I know the cost would be completely out of sight. So it's just a dream.

I had a chance back in the 80's to buy a Ranger II that was factory built, and absolutely mint. Guy wanted $100 at a swap meet. I didn't buy it and have been kicking myself ever since.

ordinary copper wire pair?

check that the devices at each end are operating correctly
and have the correct power supply etc..

maybe you need a better microphone?
possiblly one with background noise rejection.

amplify the signal before putting it into the wire
then the noise will be less significant

bandpass filter 300-3000Hz

encode the audio digitally (probably major overkill)

> professional marine application. sturdiness is more important than
> bleeding-edge performance.

keep the wires dry and waterproof all junctions...
i'd look at liquid electrical tape unless you have a superior product.

keep them away from power runs or rune them in a separate conduit from
the power

Bye.

Hi Dick,
You could take my approach. I have a Johnson Navigator in fair condition. I am 100% disassembling it- rebuilding the wire harness out of teflon, replacing all the screw with stainless, glass bead etching the chassis, silk screening the frot panel (the right way- Johnson has the worst paint jobs of any boatanchors)- and then having the fun of assembling a one of a kind rig.

FS: Motorola R2038D HS Comms System Analyzer
Motorola R-2038D HS Communications System Analyzer, in very
good condition complete with its front cover and the RTL-4055
Wattmeter Adaptor. This unit has a crisp, bright display and is
cosmetically in good shape except for a couple of scratches and
very minor dents. It was in a lab most of its life and then I got it
and used it for my repeater systems. Don't need it any more.
And its in VERY nice shape was'nt used in the field, so it did'nt get
banged around. I'm a non smoker.
*Spectrum Analyzer*Duplex Generator*Modulation Scope*General Purpose
Scope*Frequency Counter*AC-DC Voltmeter*RF Wattmeter*Multimode Code
Synthesizer*Sweep Generator*Signal Stength Meter
This Unit will take care of most all of your encoding and decoding
needs. It is also fitted with the HS. High Stability Option.
Its a nice clean and great working unit!!!!!
Make offer. Please don't ask what I want for it, just make offer and
I'm ready to sell right away. Can pick up in Essex County New Jersey
or I can ship it.

Actually we (retired and Ex ATT,Bell,SBC and now ATT again) used to do a frequency run test with an audio signal generator and a receive measuring device at the far end. If needed we would put in a equalizing unit (Wescom, Teltrend, etc) that we could adjust the 300-to 3khz slope (sometimes up to 8khz for audio program loops for radio broadcast) with to make all frequencies as flat as possible or boost the level of the freqs as needed. You can get even more technical in the time delay at different frequencies on the same copper path traveling from one end to the other. Lets see what this stirs up.

Digitizing it, then running it on a network would give you the best
voice quality, and the network can be used for other data
(environmental, remote control, alarms, ect) plus it would be relatively
simple to set up..

Source record: 11635

Sorry I tried alt.audio.equipment with no luck.

I have a Kloss model 88 radio connected to a nearby PC that has one of those Win/TV cards. I wired the audio out of the TV card to the CD inputs of the radio. The CD inputs are RCA jacks.

The setup works OK, but every once in a while the radio starts "booming". By this I mean it sounds like the bass was turned way up. If I touch or jiggle the back connection the booming goes away. The same thing happens if I use the stereo plug AUX input.

What's happening here and how do I stop it?

(PS. The radio does not have separate a grounding connection.)

SEC. 114. CRIMINAL PROVISION RELATING TO STALKING.

(a) Interstate Stalking- Section 2261A of title 18, United States Code, is amended to read as follows:

`Sec. 2261A. Stalking

`Whoever--

`(1) travels in interstate or foreign commerce or within the special maritime and territorial jurisdiction of the United States, or enters or leaves Indian country, with the intent to kill, injure, harass, or place under surveillance with intent to kill, injure, harass, or intimidate another person, and in the course of, or as a result of, such travel places that person in reasonable fear of the death of, or serious bodily injury to, or causes substantial emotional distress to that person, a member of the immediate family (as defined in section 115) of that person, or the spouse or intimate partner of that person; or

`(2) with the intent--

`(A) to kill, injure, harass, or place under surveillance with intent to kill, injure, harass, or intimidate, or cause substantial emotional distress to a person in another State or tribal jurisdiction or within the special maritime and territorial jurisdiction of the United States; or

`(B) to place a person in another State or tribal jurisdiction, or within the special maritime and territorial jurisdiction of the United States, in reasonable fear of the death of, or serious bodily injury to--

`(i) that person;

`(ii) a member of the immediate family (as defined in section 115 of that person; or

`(iii) a spouse or intimate partner of that person;

uses the mail, any interactive computer service, or any facility of interstate or foreign commerce to engage in a course of conduct that

causes substantial emotional distress to that person or places that person in reasonable fear of the death of, or serious bodily injury to, any of the persons described in clauses (i) through (iii) of subparagraph (B);

shall be punished as provided in section 2261(b) of this title.'.

(b) Enhanced Penalties for Stalking- Section 2261(b) of title 18, United States Code, is amended by adding at the end the following:

`(6) Whoever commits the crime of stalking in violation of a temporary or permanent civil or criminal injunction, restraining order, no-contact order, or other order described in section 2266 of title 18, United States Code, shall be punished by imprisonment for not less than 1 year.'.

Doug,

If I understand you correctly, you have changed over to a sort of full-sized screwdriver? If so, I might suggest that you got to a slider mount that slips into the end of a Drawtite or Reese hitch. It is shaped like a reversed "F" with the center bar of the "F" facing to the outside of the hitch. It seems you ARE suffering from vibration severe enough to cause the kind of damage you are experiencing. *IF* you ARE using basically a full-sized screwdriver, the advantage of this is you can secure the antenna FULLY at the top of the now upside down "F" with a piece of Lexan (non-conductive). It firmly prevents any "wiggle" and absorbs most of the

shock by taking most of the strain off the bottom of the antenna and spreads the load across a wider area. Granted, it is better if you can have the antenna up and away from ground losses, but my experiences have been that the securely fastened, essentially bumper-mounted antenna works quite well-and, of course, prevents the extreme shocks that a single-point mount must absorb on its own.

I hope you find a solution and I hope that I might help in your search for what has to be a very frustrating problem for you. I, too, am heavily involved in emergency comms (CAP) and I have a 3" diameter antenna that has been mounted on my Chevy S-10 for 2 years + with no problems. If you hit the mount, it would probably destroy the antenna and mount.

Anyone out there mounted an FT-857D in a Mazda B4000 pickup? I have a 1997 B4000, 5-speed, 4WD, and want to put my FT-857D in the truck.

Antennas are no problem -- I will use two stake hole mounts from GeoTool and mount two antennas in the rear stake holes -- VHF/UHF and ATAS-120. Coax will route inside the sides of the bed, under the cab, and into the cab through a hole I drilled in the cavity where the jump seats stow.

The body of the radio will mount on the floor under the driver's seat. Antenna cables will run under the carpet to the radio coming out through a small slit in the carpet. Power cable comes from the battery, over the wheel well, under the truck and up through a hole similar to the antenna cable, then under the carpet to the radio body.

Question is: Where to put the control head?

If I mount it on the floor between the gear shift and the front edge of the seat, I have to lean WAY over to operate the knobs. I could build some sort of platform that secures to the floor between the gear shift and the front edge of the seat, thereby elevating the control head so it's within easy reach.

Another thought I had was to remove the stock AM/FM radio -- which is a double-DIN size -- and replace it with a standard DIN-sized radio. This would leave a DIN-sized hole in the dash where I could put a metal plate painted flat black and mount the control head there, putting it generally in the same place as the car radio.

Any assistance will be appreciated.

112. EF Johnson transistor cross reference needed....

Newsgroup: rec.radio.amateur.equipment
Date: 2006-01-13 02:46:59 UTC

I'm working on an EF Johnson 1200 series 440 MHz repeater.
One of the transistors in the transmitter is fried, and I have had
no luck finding a replacement. Can anyone help with a cross
reference?

the Johnson part number is 576-0004-055

Its a white, ceramic case with the 4 wide leads. Many RF power
transistors of this type have a stud to attach it to a heatsink.
This one does not.

It has the Motorola symbol, but only the Johnson part number.
I've looked though Motorola data books and cannot even find
this package style.

Steve

Anybody parting out a Drake 2A or 2B receiver?

I need a cabinet and a set of knobs for a 2B that I'm
bringing back to life. It was damaged during shipment
due to very poor packing. The condition of the paint
on the cabinet is not important, as long as the metal
is not dented, bent, or badly rusted (light surface
rust is okay). I'll strip and repaint it. The knobs
need to be good ones with no cracks and decent chrome.

Can somebody help me out here?

73,
Dean K5DH

Hi Dean,
Sorry to hear of the damage to the Drake.
If you end up repainting (and you likely know this) use a Rustoleum Auto Gray Primer over the bare metal and follow it with Rustoleum satin black #7777- a very nice match for the 2A/2B- perhaps 2 coats with wet sanding in between to remove any dust/dirt. MY painter lost my silk screen and artwork for the 2B, so no more front panels.

GL,
Dale W4OP

I was a US Army broadcast engineer at Ft Greely, AK back in the early
'70s. Our AFRN network feed came through the "White Alice" microwave
network. By the time it reached our station the level was so low that I
had to use a spare magnetic phono preamp from our old transcription
turntable to bring the feed up to line level. Before that, when they
went from network to live, or back to the network they had to reset the
levels. Repeated requests were made to fix the feed, but we were always
told that the level was ok in Fairbanks, and the problem must be on our
end of the feed because the phones worked.

As I recall, the telco-techno correct language for that is: "the trouble is leaving here ok," which is used almost as often as: "trouble came clear while kicking bay."

I am in need of someone with a Icom 756pro or Pro II or III
service manual.
I would like to find out how to take the glass off the display?

I want to replace it because i have a scratch (Not to noticeable)
But it's still there and if possible to replace. It looks like and easy
fix.

Thanks for any help.

Steve

From: Roger Rabbit <Roger.Rabbit.not.valid@aol.com>
Message-ID: <m6oss1dl23dh73bbcnfn0nbggevl40fbis@4ax.com>
Source record: 11687

My Kenwood TS-450sat has both 2.4 KHz filters installed and only the 500 Hz CW positions empty. I would like to install the YK-88SN-1 filter. Can I plug the YK-88SN-1 1.8 KHz filter in one of the open positions normally used for the 500 Hz CW filter? I'm hoping to be able to use the two 2.4 KHz filters for normal operation, and then switch to the 1.8 KHz filter in the 500 setting when someone is parked closer than 3 KHz away.

Thanks in advanced..

-Michael

That is exactly the way my TS-450sat is configured - works great.

I also have a YG-455CN-1 250 Hz filter in the 455 kHz slot and end up with
the best of both worlds.

Dave

153. How to open ICOM BP160 or BP-131 packs?

Newsgroup: rec.radio.amateur.equipment
Date: 2006-01-18 17:51:08 UTC
From: gsm@mendelson.com
Message-ID: <slrndssbht.1ph.gsm@cable.mendelson.com>
Source record: 11689

Hi guys,

I have a BP-160 and a BP-131 pack that are dead. I'd like to "refill" them with locally available batteries, but can not get them open.

I'm in Israel, so it is not possible to just order a replacment or a refill kit from the U.S. and there is NO ICOM dealer in this country.

I tried warming them with a hair dryer, but it did not seem to have any effect. If they are sealed with melted glue, eventualy the heat will open them, if they were ultrasonicly welded then I need to use a dremel :-(

I found one web site that sells replacement inserts, but there was no information I could find on the web on how to open them in the first place.

Any help would be greatfully appriciated.

Thanks in advance and 73,

Geoff.

Hi Geoff, I believe they are ultrasonically welded together. What does
work (most of the time)
is to put the battery pack in the freezer and let it stay in there for
an hour or so.
When you take it out I usually put it on a solid floor with a "smack".
DON'T throw it, smack it down.
Most times this works fine.
If you smack it to hard, you may crack the case. Even if you get it
opened a little bit you can usually
split it further with a flat blade screwdriver. I have been doing this
for many years now, usually with good results.
In the days of the Icom IC-2AT or the IC-02ATs, the battery pack was
screwed together making it super easy
to refill it. Good Luck to you..

I have for sale a nice Malcomized Yaesu FT-102 Station:
1. FT-102 fully Malcomized by Malcolm Eiselman, NC4L, with little use since work was done 8/26/03. Over $600 charge. Transceiver has AM/FM Board, XF-455C CW Filter not installed, Handmic, Power Cable, Original Manual. Works great, 200 watts out. Cosmetically, it is very good. It does have a few small
scratches around front trim, but not bad. Front Panel and Cabinet are in great condition. Also has 455 IF AM Filter installed.
All documentation from Mal included. Price is $775;
2. FV-102DM Synthesized digital VFO with Memories. Very stable. It has also been gone over by Malcolm in Dec. 2005 and works perfectly.
Cosmetically, it is very good. It comes with original manual and all cables. Price is $375;
3. FC-102 Antenna Tuner. In as new condition with Original Box. Works Perfect and looks new. Meter lights work. Comes with Original Manual and the cable for the the meter lights. Very little use. Price is$325
Shipping from 79602 extra. Package price for all items listed is $1375.
Digital Pictures available. Thanks, Charlie Hugg, K5MBX

Put them in a freezer for a couple of hours, THEN put a utility knife
blade on the seam, and tap a couple of times with a small hammer...
Works great with the older Standard battery packs and I don't see why
it shouldn't with old Icom battery packs...

I ordered the YK-88SN-1 from HRO yesterday after reading your
reply. It looks like the YG-455CN-1 has been discontinued. Inrad has
a similar filter available for the Kenwood 450, but it is $155.00.
Perhaps I'll watch Ebay for awhile and see what comes up.

Thanks for your help.

Date: 2006-01-20 18:55:03 UTC
From: Ralf Ballis - DL2MRB <dl2mrb@arcor.de>
Message-ID: <43d13263$0$21030$9b4e6d93@newsread2.arcor-online.net>
Source record: 11554

Seeking for a service manual for my FT-290 R/II on the net to download.
Where can I find one, www.mods.dk doesn't have one.

Regards,

Ralf

169. Yaesu FT-857 vs. FT-897

Newsgroup: rec.radio.amateur.equipment
Date: 2006-01-20 20:54:05 UTC
From: west <westley@tampabay.rr.com>
Message-ID: <N5cAf.10445$Zj7.6849@tornado.tampabay.rr.com>
Source record: 11555

Does the Yaesu FT-897 essentially have the same receiver & transmitter as the FT-857? If yes, then why does the 897 weigh about 40% more? Besides battery operation what does the 897 have over the 857? Thanks in advance for any comments.

Cordially,
west

Never used either, but have seen both up close. Off hand, I can see
that the larger housing, with internal brackets to hold batteries, plus the
larger display, would be contributing a lot to the weight difference.

A friend of mine inherited some HAM gear when his father passed away. He, himself, is not a HAM. He needs to find a home for his father's equipment. He is willing to give it to anyone who will pay the shipping or pick it up at his place. He has no idea what any of it is, but would rather give it to someone who can use it than send it to the car crusher in an old car (his only other option). I offered to post pictures of the stuff, but I need to know where to post it so HAMs could find it. Does this NG have a binaries group that you guys use as a binaries portal? Would someone be willing to post the pictures on their website?

Rick

Some clue as to where your friend is located, at least to state may find someone local who would grab it up. You also may wish to get the nomenclature which might be a good hint for the rest of us as to what is valuable and what is recycler material. You might also check Ebay. There are often ads with just the dilemma you pose...inherited equipment. There are many afficionados who do bid on this. Look for brand names such as Heath (or Heathkit) Hammarlund, Collins, Hallicrafter, Nationa Receiver, Drake, Johnson Viking for which there are many ham hobbyist who restore this stuff. Check out Ebay, plug some of those names or ham transmitter into it. Also try the words ham receiver, ham transceiver and see if any of this is recognizable. Some of this stuff is very heavy so some folks might think twice about having it shipped unless they could have the option of a local pickup or maybe a couple hundred miles drive with an SUV or truck. There are a few guys who buy whole estates, fix up and resell this stuff to folks interested in antique radios (which means almost anything before the transistorr era. Equipment for the 50'/60's are particularly interesting to many. More modern equipment, being simply used vice antique will sell or not sell based upon its intrinsic merits. If you give us a city, we might be able to provide you with a point of contact for a nearby radio club whose members could help you.

Hi Rick,

best would be to find a reliable ham who can help you with valuing the stuff. Find one through one of the local radioclubs (addresses via www.arrl.org for example). If he want to do it the easy way, donate the equipment to some type of charity which can handle the sale. http://www.wb2jkj.org/ is one which I see advertising all the time, check them out. If all else fails - call your local NPR radio station, most will accept donations. Some of this old stuff can be very valuable when sold on Ebay but it takes some knowledge.

I have frozen the FNB28 battery case to open it up, and it has worked perfectly, but when replacing the rechargable cells, do you keep the components such as the thermal overload etc in the case, or has freezing destroyed them?

Wire all EXACTLY the same way, just replace the cells out....
I have done this with my Standard packs, and doubled the capacity by
switching to better cells with the same dimensions....

I asked a similar question about ICOM packs (I didn't know about freezing)
and found that the problems that I had were related to corrosion,
which destroyed the microphone (ICOM had microphones in their packs
for a while, for full duplex operation) and a really cheap heat sensor
in an OEM (Periphex, circa 1995) pack whose leads broke off.

I replaced them with NiCad cells because I did not have a charger that
could charge NiMH cells properly and I had a bunch of them in the junkbox.

73,

Geoff.

Have you considered giving the gear to a Ham Radio School club ??
In San Diego, we have supplied three schools with like items.

If it is too old, then the school kids can take it to an auction or e-bay it
and apply the funds to more modern gear.

Or there are some shut in poor seniors that would be worty of a donation

It would be a great help if we knew where the equipment was located (i.e.
what corner of what state?)

If it is anywhere near Sacramento CA, the ham club at Sierra College would
be very grateful for the donation of equipment.

199. Mobile installation question

Newsgroup: rec.radio.amateur.equipment
Date: 2006-01-22 22:10:58 UTC
From: "Joe S." <anon@mous.com>
Message-ID: <HMudneUWRbBGn0nenZ2dnUVZ_tmdnZ2d@comcast.com>
Source record: 11585
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.misc,rec.radio.amateur.equipment

This question does not fit perfectly into any rec.radio.amateur newsgroup so I'll cross-post it to three groups and hope someone can help me.

The question involves the dangers of RF energy from HF, VHF, and UHF rigs around automobile electronics.

I am installing a Yaesu FT-857D in a 1997 Mazda B4000 truck -- 4.0L V6, 4WD, 5-speed, with extended cab.

The control head for the 857 is separated and mounted on the plastic bezel around the gear shift lever. The rig is mounted on the floor under the driver's seat.

Underneath the truck, on the rocker panel just beneath the seatbelt anchor point, is a factory-made hole in the floor. This hole is closed with a removable rubber plug. I ran the radio's power lead through this rubber plug, along the frame, into the engine compartment where I attached the positive lead to the battery and the negative lead to chassis ground.

I planned to run the antenna leads out through the same hole then run them along the frame into the sidewall of the bed to the rear of the truck where I will mount a VHF/UHF antenna in one rear stake hole and an ATAS-120 in the other rear stake hole, using the GeoTools mount:
http://www.geotool.com/antmount.htm

I took the truck in for service last week and the service advisor gave me a long lecture about keeping the coax away from the air bag and away from the seatbelt retractor. He told me the retractor has a small explosive charge in it that can be set off by radiation from coax. Ditto for the airbag.

The route I planned for the coax takes it right next to the seatbelt retractor and I am now re-thinking my installation. I could route the coax from underneath the driver's seat directly to the back of the cab and drill a hole in the floorboard, centered on the cab at the back wall of the cab, and run the coax out of that hole. This would get a foot or more separation between the coax and the retractor.

I plan to ground the hell out of this installation.
-- The power lead is grounded to the frame in the engine compartment.
-- I have a 10 gauge pigtail -- one end will be bolted under one of the bolts that attaches the seat frame to the floorboard and the other end will be bolted to the 857 chassis.
-- The antenna mounts bolt directly onto the chassis; I will sand off the paint and use star washers to get good contacts at these mounting points.

Also, I will use double-shielded RG-8X for the coax.

I see a lot of trucks like mine (the B4000 is the same truck as the Ford Ranger) with CB installations -- I have never stopped anyone and asked but it seems to me the normal CB installation is nowhere near as good as mine and they don't seem to have problems. Of course, I'm running 100 watts and they are running only 5 (right???).

Has anyone out there had experience with HF mobile installations in the Mazda or Ranger pickups?

Thanks for your assistance.

You ought to think the hell out of your grounding plans first.

Remember, "grounding" simply provides a current path that did not exist before. This can be good or it can be bad. Know what current is flowing and where and why. "Grounding" stuff willy-nilly is not good engineering. Make the current go where *you* want it to go or not go.

It sounds to me like the only issue you might have is the coax running near that seatbelt retractor. The thing that puzzles me is this guy telling you there is a small explosive charge in the seatbelt retractor. I never heard of such thing in my 30+ years of doing radio installations. I would like to hear from anyone else here who has! I sure have no idea what the purpose of this charge would be.

They are the latest things, called "pre-tensioners" they fire along with
the airbags. I would think that routing the coax as far away as possible
and making sure the radio and the antenna base (and antenna end of coax
shield) are securely grounded would be sufficient.

He should carefully check all options to see if their is a way to avoid
most of the wiring loom in the vehicle.

The use of the stake mounts, concerns me because they might not ensure
mettalic grounding of the antenna. I would make sure the antenna is
grounded to the truck bed and the truck bed to the vehicle frame by
short <1/8 wavelength wires.

I would check with the Mazda dealer for a technical service bulletin
on radio installations. I know Chrysler does a great job in this
area. Because of all the computers, etc. in cars and trucks today I
would think most of the manufacturers would provide the same thing.

Dick

I use the through hole in the floor of my Ranger [Ford] as you describe.

Coax should have no rf current on the outside of the cable assuming a
good ground at the antenna.

~~~~~~

Nonsense.

Current on the outside of the coax is caused by imbalance in the
antenna. A good ground will not get rid of it, in fact it may well be
the cause if the ground has a different impedance than the antenna.

FS: REAL NICE HAMMARLUND HQ180

Great cosmetic and electrical shape, just realigned. I am presently using this receiver on on 75/160M AM. Plays great, looks great. Has been retubed, old/defective components replaced, and cleaned. Tested from 540 khz to 30 Mhz and it pulls in signals as well as an FT1000MP sitting next to it. Stable and calibrated. On AM it has better selectivity and audio than the MP. On sideband it sounds good and has minimal drift. Has aftermarket clock, includes manual. Looks every bit as good as the pictures (which will be emailed on request).

Price is $425.00. I prefer not to ship this, due to risk of damage by carrier. I am in the Kansas City area and will drive 100 mile radius to meet buyer. I will ship if you insist, but cost of double boxing, packing materials, and freight charges are responsibility of buyer. I do not intend to make money on the packing/shipping, just want to make sure the item arrives at your location without damage or hassles!

I also have the matching S200 speaker (sounds GREAT) in equally good cosmetic/electrical condition. Inquire if interested.

Send me your email address and I'll send photos and answer any questions.

If you received your Technician license prior to 1987 (I think the cutoff data is sometime in April 1997), then all you have to do is bring proof of that to a VE test session, fill out the upgrade application, pay the processing fee and that's it.

If you received your Tech Plus (at times called Tech with code instead of Tech Plus) between 1987 and the restructuring of April 2000, you will need to bring proof of that to a VE test session, pay the fee, take and pass the General written test, and fill out the upgrade application.

If you received your Tech with code after the cutoff date in April 2000 and your code CSCE is more than a year old, you will have to take and pass the code again and take and pass the General written. If your code CSCE is less than a year old, you will only have to take the General written. Of course you will need to have the original and a copy of the CSCE.

For all paper work, take both the original and a copy. The VE team will need to have the copy to attach to the paperwork filed with the VEC.

Bill, the discussion is about a MOBILE installation. The antenna is end fed against ground, not a balanced dipole type.

What bands and power are you running? 40 through 0.7 meters at full
IC-706 MK IIg output [100 watts on HF, reduced on VHF/UHF]

Where is your antenna mounted? OHF on the bed wall near the tail gate.
VHF/UHF on the cab window.

Ever had any malfunctions caused by RF? NOPE!!

Thanks. Your installation is almost identical to mine:
-- FT-857, 100 watts on HF, 25 or so on VHF/UHF
-- Antennas mounted on the rear corners of the bed, in the rear stake holes.

I'm using double-braid RG-8X.

It would help if you told us where you were located. The state and
city would be enough for someone to point you to a local ham or club
that could help you.

I have a nice die-cast Radio Shack bookshelf speaker I bought probably 15 years ago that I use on my SW/Ham radios. It's not a perfect speaker but it's fairly mellow, not at all tinny, and extremely durable.

I think Radio Shack sold them as outdoor/patio type speakers when I bought them and I seem to recall the name "Minimus-7".

I go to look at Radio Shack and they don't have anything like this anymore. They've got some really crappy plastic-tinny sounding speakers that I don't like at all, and would probably break the first time I looked at it funny.

What speakers are available in durable die-cast housings these days? And I hate tinny sound (like comes out of a PC-clone speaker). I refuse (just out of abhorrence of the sound) to look at any PC or PC-with-amplified-subwoofer crap speakers.

Did I mention that I don't want any PC speakers, and they all sound awful? (Hint, hint, DO NOT SUGGEST THIS OPTION!)

Tim.

I agree, the Minimus 7 speaker worked very well for shortwave listening.

I'm well aware of that. A 1:1 choke type balun at the antenna feed
point will make it a balanced system and the RF on the coax problem
will vanish.

You can find minimus-7's and 77's on eBay. I
found a couple at a yard sale last year. If you
find one and you want to upgrade it a bit,
you can go to partsexpress.com and you
can find a project there that someone did to
replace the drivers in the minimus-77's to
achieve better sound.

Tim, you might also search for the name "Optimus" Same cast Al case and speakers with internal crossover networks. Same speakers as the Minimus, different timeframe. IMHO, neither sound near as good as a good set of stereo phones, but agree that it's easier to demonstrate to visitors using the speakers.

Regards
W4ZCB

240. Good Speakers for Radio-Receiver Listening - Mainly for the Human Voice and some Music

Tim / TE,

Look on eBay for one of the Center Channel Speakers from a
Sound-A-Sound System that has a Wooden {Particle-Board}
Speaker Enclosure. These usually have a Pair of 4" to 5.25"
Mid-Range Speakers and a much smaller Tweeter placed
between them.

Here is an Example of a Center Channel Speakers Listed on eBay :
JBL EC25BE 2-Way Dual 5-Inch Center Channel Speaker
http://cgi.ebay.com/_W0QQitemZ5858432743
The NorthridgeTM E Series EC25BE center channel loudspeaker was
custom-designed to superbly reproduce the human voice. Many movie
soundtracks consist mainly of dialogue, so that the center speaker
shoulders the burden of filling a home theater.

"The 'SOUNDS SWEET' Communications speakers maximize intelligibility
from your transceiver, receiver or portable by reproducing only the
communications voice and shortwave music frequencies coming from your
SSB, AM or FM communication or shortwave radio."
GoTo=> http://www.soundssweet.com/
A Little "Pricey" at $99.

Also, if you are using one of the 'portable' AM/FM Shortwave Radios.
Check-Out the Kiwa "Audio" Mods for a better sound from your radio.
[The Speaker is only as 'good' as the electronics that is driving it.]
KIWA=> http://www.kiwa.com/index.html

FWIW - External Speakers for the ICOM IC-R75
http://groups.yahoo.com/group/icomr75/message/4360
Here are the Two Most Often Recommended External Speakers
for the Icom IC-R75; as suggested by the Members of ths eGroup.

#1. RCA Mini-Speaker Pro-X33AV
Radio Shack Cat #40-5000
http://groups.yahoo.com/group/icomr75/message/1312
A shielded 2-way speaker with a 3" woofer
and a dome tweeter about 6.5" high.

#2. RCA 20-Watt Full Range Mini-Speaker
Radio Shack Cat # 40-5024
http://groups.yahoo.com/group/icomr75/message/2031
http://groups.yahoo.com/group/icomr75/message/769
A shielded full range 4" speaker. It is a Black 5" cube.

NOTE: The general comment is that both of the above external
speakers in the "Black Color" looks very sharp next to the R-75.

OTHER - Speakers mentioned frequently that are good with the R75.
* Optimus PRO-X88AV's RadioShack Cat # 40-2084.
* Barjan PROnouncer (320-25) 4".
* Radio Shack XTS 25 (40-1999A)
* Radio Shack 21-549A isn't a 'full range' music speaker. It is
a 'communication/voice' speaker.
* Minimus 7 Speaker by RadioShack 4" Speaker
* KLH 911's (2-way semi-compact at about a foot tall)
* Mocom 70 4".
* Grove SP-200B sound enhancer

NOTE - Most 'matching' Speakers offered by OEM manufactures
are basic 3"-4" Speakers in a Sealed or Ported in Metal Enclosure
designed to opperate on a few Watts output. A simple Speaker in
a tin box for $60-$120. But Hey it 'matches the Receiver and has
the OEM's 'Brand Name' on it.

Go to Ebay and buy used Minimus speakers...

Search for minimus, radio shack, and RCA, the last brand on them..

I have a set of the RCA and two set's of RS Minimus, and the RCA and the
newer of the two Minimus are exactly the same, except for the RCA logo.

I give up!! Obviously my 52 years of mobile installations were all wrong!

A vertical fed against ground is by definition a perfect match for coax.
There is no need to make it a 'balanced system'. If rf exists on the
coax there is a poor ground in the system that should be addressed and
solved.

More likely you have had one year of experience 52 times.

Consider an eight foot center loaded whip on 80 meters. The feedpoint impedance of the whip is going to be very small - an ohm or two. Worked against an automobile chassis which, capacity coupled to the earth, will have an impedance of somewhere between 10-36 ohms, you will have major imbalance. No amount of "grounding" will improve the imbalance. In fact, just the opposite. The closer you come to the theoretical perfect 36 ohm ground, the worse the imbalance gets.

Now whether this is a problem in a particular installation is a different question, but the imbalance is there. The coax will have a large differential current flowing on the outside as a direct result of that imbalance. Some authors will tell you how important it is to ground the chassis of your transceiver to get rid of this current. Do that if you want, but I think it's better to keep that current away from your transceiver in the first place. A current-type choke at the whip's base will prevent that current from flowing and will keep it in the antenna and in the car's body where it belongs instead of on the outside of the coax. Done properly, your transceiver's chassis should have no RF on it to need grounding in the first place.

I don't understand this at all. What does antenna feedpoint impedance
have to do with imbalance?

I know of two causes of current on the outside of a coax cable,
conduction and mutual coupling, and I think I understand the mechanisms
quite well. But neither has anything to do with the antenna feedpoint
impedance. Can you explain what the mechanism is for an impedance
mismatch to cause a current on the outside of the coax?

Roy Lewallen, W7EL

Bill, could you explain what you mean here? Where is the
second equal-magnitude/opposite-phase current flowing?
Through the vehicle chassis? Through the ground under
the chassis? Since the vehicle's counterpoise currents
are necessary for resonance, what good does it do to
choke the coax currents when the coax braid is connected
to the vehicle chassis at both ends?

~~~~~~

The impedance mismatch I was talking about is between the halves of the antenna, not between the antenna and the coax. A mobile antenna with a typical center loaded whip operating on a relatively low frequency such as 80 or 40 meters is severely unbalanced in that respect. That does not mean it won't work or is inefficient or anything of the like. Only that it is unbalanced, much like a non-resonant long wire worked against ground.

The coax braid may be connected to the chassis at the antenna end, but not at the transceiver end, and the result is often a "hot" chassis. Some "experts" advise to ground the chassis with a short, heavy conductor to cure the problem, but I feel it's better to keep such currents off the coax to begin with.

That does not mean such methods don't work or are inefficient. I have operated both ways and both ways work. I just prefer not trying to "ground" current which should not be there in the first place.

I would be interested in hearing and seeing examples of very small workshops (closets/small apartments/small bedrooms) and how people have adapted a workshop to a very small space. Pictures or links to pictures would be great. I would think the challenges of lighting, ventilation, power and space would create some interesting solutions. Any articles that discuss this subject would also be welcome.

Thanks for any contributions you might offer.

It's not every day I post a followup to my own message, but it seems appropriate here.

If you would like to experiment with this, try operating 17 meter mobile. If your installation is like mine, the length of coax will be very close to 1/4 wave on 17 (about 13 feet) and the transceiver's chassis will be "hot" for RF. We all know about a 1/4 wave conductor grounded at one and what happens at the other end.

I believe - correct me if I'm wrong - that current on the outside of coax is not subject to the velocity factor issue because what's inside the coax is not involved. It's just like a piece of wire in this respect.

It would be interesting to try it with a 26 foot coax but I haven't gotten around to it yet. Most likely it would only be effective on the one band anyway, since 17 isn't harmonically related to any other HF band.

WOW, too bad I didn't see this about 20 years ago. Three experiences - I had a back room in our basement - the house being 4 rooms - small at that. The room I got was like 5'4" high, which I had to duck to walk into as there was a step up into it - were it flat with the rest of the basement - I'd have had no trouble. It was about 6' deep from door to back wall and 5' wide. I had two very small tables in it, a chair and used the small nooks and crannies for storage. The one table being my bench. I was crowded - but I can say - all was in easy reach..... I even had a stereo there for music, bright lights for total illumination, and a few other nice additions. In another home I lived in, I had a small closet for my workbench "and" Ham shack, we were in an apartment building, no basement and the new bride didn't want to see the stuff. Crowded as much as if not more than my room as mentioned above, but hey - it worked for the time. There is something to be said about those close quarters - one thing as I mentioned, all in easy reach. I have a lot more room now, but I DO sort of miss those days! It just goes to show, you adapt when you have to. The more room you get - the more junk you tend to rack up.... As to lighting, I addressed mine as mentioned. Ventilation, it could get stuffy, if soldering a lot - if working on tube equipment, it could get warm. And, if ya ate something good for dinner, you could stink yourself out too! Power - you tend to utilize all sockets and pipe some in from outter rooms if need be. It isn't the end of the world having to deal with such an issue. As they say, ya gotta do - what ya gotta do..... I've even had my work areas when staying in a 26' camper - utilizing - again, any available space. Actually - it can be neat! Its all in how you lay it out and approach it in your mind. One thing - DO NOT block yourself in - in case of fire or shock hazard. Take any appropriate precautions against fire and so on.

Hint for increasing storage space where there is little wall space
available.
For doubling the storage capacity of an existing
wall of steel cased,plastic drawered component
storage cabinets.
Obtain some extruded aluminium channel sliding
door gear used in domestic clothes cupboards etc.
Fix the runners to the top of the cabinet/cabinets.Fix channel to
ceiling/stout shelf in
front of and above(to avoid fouling top layer of drawers) the existing wall
mounted cabinets.
Fix a couple of PTFE slabs to base/rear to run against a sheet of wood or
metal fixed under
the existing units. Cabinets can be doubled up,pop-rivetted together
vertically with bridging
plates across the joins. Even trebled up if heavy components are placed in
the wall mounted units. For every
3 existing units maximum of 2 sliding ones for access,for 4 fixed then 3
sliding etc.
Theoretically 2 layers of sliding and 1 layer fixed cabinets would be
possible.

Other than the obvious comment - more mains outlets,
anyone any ideas for avoiding the rat's nest of knotted mains leads to
numerous test gear hanging around for perhaps once or twice a month use, so
not on a shelf
for once a year use. ?

Wouldn't you still get RF burns if you touch the floating
transceiver chassis and anything "grounded" to the vehicle
chassis at the same time?

Guilty m'lud. However I dont see what the challenges are exactly.
Lighting is the same as anywhere else, except you'll only have 2 lights
on at most. Ventilation, I assume it has a door and window. If not, it
still has a door... one hopes!

Power is simple enough, just flex and multiple sockets, route the flex
wherever it can go. Modern 4/6/8 way sockets have made this very quick
to implement. Wiring them in pairs makes them usful, 4 outlets isnt
much use. Shortening leads can avoid a whole lotta wiring mess. 2x IEC
leads in one plug tidies things up too. Many British plugs will grip 2
flexes happily, though not all.

Space... it all follows simply from one basic concept: storage
effciency. Storage efficiency is the volume of goods divided by the
volume of space its stored in. If you have say a 2'x4' table, and have
1 foot depth of kit on it, and another 1' underneath, your efficiency
is 2'/8', 25%. (8' is the floor to ceiling height). Always store from
floor to ceiling, any unused space is not good. Using standardised box
sizes makes for better packing than odd sizes.

Theres nothing difficult about working in small workshops, as long as
you dont care about neatness, order, and dont mind working with goods
stored overhead, wires running up table legs, narrow access passages
and so on. Forget about swivel chairs.

Dont forget to make the storage boxes as frogs legs, heads, arteries,
etc. It keeps visitors at bay.

one last point: you wont see pics of small workshops. Its not possible
to capture the whole shop, or even much of it, from one camera
position. And to see anything you'd need a very wide angle lens, which
most people dont have.

Can't get a picture because it was in my previous house...

Six foot wide closet with folding doors.

Bought a pre-made Formica kitchen counter at Home Depot, notched it to
fit and dropped it in as my bench.

Multiple outlet strip across the back. Parts cabinets above.
Fluorescent fixture above, plus a small goose-neck for close-up
illumination.

Close the doors and you weren't aware it was there... wife loved it
;-)

Now-a-days I solder maybe twice a year... haul out scope, signal
generator and DVM, and just do it on my office desk.

Best thing I ever did was to use kitchen tops for the workbench.As
they have a sloping edge,I placed two together with the slope abutting
in the middle to form a V shape.
this has caught more dropped screws etc also a good place to lay
screwdrivers etc to stop them rolling off the bench.A good safety
idea,well at least for me.regards

Guess I don't understand what you mean by an impedance mismatch between halves of an antenna. Can you elaborate a bit, and how it causes current to get to the outside of the coax?

There's no reason a non-resonant long wire worked against ground should produce more current on the outside of a coax feedline than a resonant one. The conducted current on the outside of the coax is determined by the relative impedances to ground of the two available paths at the shield connection at the end of the coax. In the case of a grounded antenna, the ground system is one of the paths. The other is the outside of the coax. If the ground system is any good, its impedance is much lower than the outside of the coax, so very little current flows on the coax. Changing the "antenna" makes very little difference to the relationship between those paths, so it has very little effect on the current conducted to the outside of the feedline. You can find a more detailed explanation at http://eznec.com/Amateur/Articles/Baluns.pdf.

Unless you're using the shield strictly for electric field shielding at very low (like audio) frequencies, you should *always* connect the shield at both ends, with low inductance connections. Think of a rig with an SO-239 connector. There's current coming out of the center pin, and there's an equal amount flowing in the opposite direction on the inside of the shell part of the connector. And inside a coax, there are equal and opposite currents on the outside of the center conductor and the inside of the shield. If you connect a coax to the rig via a properly installed PL-259, all the current on the inside of the SO-239 shell ends up inside the coax shield, and all the current from the SO-239 center pin ends up on the coax center conductor. Both sets of conditions are satisfied, and there's no current left over to flow on the outside of the coax or the outside of the rig. But what happens if you cut the shield at the rig? Then the current on the inside of the SO-239 shell has nowhere to go but over the edge and over the outside of the rig. And the current on the inside of the coax shield flows over the edge of the coax and along its outside. Somehow there'll be a path between the two, by conduction or coupling -- otherwise the rig would see an infinite impedance and no current would flow at all. But you probably won't like the path the current takes. It'll cause radiation from whatever it flows on, and because of the path impedance, RF voltage drops will be created between the coax shield and the rig, and anything else in the path. You might be able to alter its path with "ground"

wires and such, but you'll have a lot of trouble controlling it, and it'll always be flowing somewhere besides where it should be -- on the inside of the coax.

I'd be surprised at BPL causing this, given its low signal strength,
but I suppose something to consider. I recall hearing of some new
military "secure" communications system having such effect on garage
doors.... but occurs over many square miles, not just one small local.
The problem I read about was back in the South East, I think.

I guess if just a couple houses next to each other are having issues,
one would begin to look in that vicinity.

>anyone else has seen this.

BPL would not, I think, as all of the BPL systems I've heard of use HF
and lowband VHF on the power lines (and some use 2.4 gig or other
ISM-band frequencies for uplink to the ISP).

I have heard of people having serious problems with Part 15 devices
which operate in the 433 MHz region (as many garage door openers do).
The primary user of this slice of spectrum is the U.S. government...
it's allocated for radiolocation (radar) and there may be other
government communications in that band as well, I suspect. Some
months ago there were reports of people living around certain
government air bases and other installations began having
garage-door-opener blackouts, because some new radar systems had gone
into use and were interfering with the Part 15 receivers.

There might be similar problems in the 900 MHz ISM band, I suppose.

A local amateur radio operator transmitting in either the 70 cm or 33
cm amateur band might cause transient overload of a Part 15 receiver
using these frequencies. I'd expect this to be a relatively
short-lived phenomenon, unless somebody's operating a popular repeater
in your neighborhood.

I noticed Texas Towers removed the listing for the Yaesu Mark V
Field from their web page, and HRO only has demo units available. Is
the Mark V Field discontinued or just temporarily sold out?

-Curious

Thanks to all who replied -- I certainly appreciate everyone taking time to help me. Of course, as usually happens with newsgroups, the thread wandered somewhat from the original question -- which was how to route my coax and mount my rig so as to avoid firing the seat belt retractor.

I have solved the problem -- the dealer had a tech bulletin that told me to keep coax 12 inches from the retractor and to ground everything -- so -- I drilled a 1-inch diameter hole in the floor board under the driver's seat and installed a plastic plug in the hole. I drilled two 1/4-inch diameter holes in the plug through which I routed the coax -- one cable for HF, one for VHF/UHF. Grounded the negative power lead to the chassis in the engine compartment; grounded the rig (which is under the driver's seat) to the frame by loosening a seat mounting bolt and grounding one end of a pigtail to that bolt and the other end of the pigtail goes to the rig's chassis.

The stake hole mounts have mounting bolts in their bottoms. Remove the tail light assembly; drill a 5/8-inch hole in the bottom of the bracket in the stake hole; grind off the paint from around the hole with a Dremel tool; put star lock washers on the bolt that comes out the bottom of the stake hole mount and tighten the living shit out of the mounting bolt, thereby grounding the antenna mount to the chassis sheet metal. There are already factory-installed ground jumpers connecting the sheet metal to the frame.

Fired it up at full power and nothing bad happened; SWR looks good; ATAS-tunes normally; made a few contacts on HF, VHF, and UHF.

I'll post photos, etc., to my web site in a few days when I get it all cleaned up.

You'd be somewhat better off running the power-ground wire all the way
back to the battery, and connecting directly to the battery's negative
post. Include a fuse in this line just before it connects to the
battery negative.

Avoid using the body frame for high-current power supply ground
return. It's too easy for noise from other portions of the
electronics to get into your power, due to the non-zero resistance of
the shared ground path.

Clamping a couple of RF-suppression ferrites onto each coax at various
points along their runs might also help block, or dissipate, any RF
which does try to come back along the coax.

>The stake hole mounts have mounting bolts in their bottoms. Remove the tail

Adding a corrosion-preventive antioxidant paste or cream between the
chassis, washer, and bolt is a good idea, also. It'll help make sure
that infiltration of oxygen and moisture does not cause this critical
grounding junction to go high-Z in the future.

There are numerous such pastes/products on the market. The one I used
is a copper-loaded grease marketed by Butternut, under the cutesie
name "Butter-it's-not". You might be able to find an equally usable
copper-grease at a good auto-supply store.

There have been problems with military use of the 300 MHz band for new radio systems, but this would not cause the door to work only half way.

Assuming the neighbors problems are coincidental, check the counterbalance spring for the door. They wear out or break and the opener does not have enough power to work on irs own. By the way this is not a DIY project because of safety concerns with the springs and the repairs can be about $300.

Good point!

I recently had a spring break in our 1960-vintage rolling door
setup... the door wouldn't even start to roll up with only one spring
out of two providing proper tension.

The repairman who came out and replaced it, said that he gets a
significant percentage of his business from people who first tried to
do the repair themselves... and decided to call him after they got out
of the hospital. The most common injury seems to be a broken
collar-bone. Those springs are under a *lot* of tension.

Thanks. I'll do all of that. I can pick up ferrites at Radio Shack and should be able to find the anti-oxidant paste at local auto parts place. In fact, local auto parts has big ferrites -- they sell them as noise suppressors for audio installations.

This garage door and opener system are not more than a year old. I don't know the brand name, but it was not inexpensive. The door does operate perfectly with the wall button. The service people have been out and changed out both the receiver and the remotes. Still will not operate. That's why the serviceman thinks it has to be some kind of RF interference. Apparently he didn't have the equipment to trace it out.

For the record, this home is in an older residential area near the University of California Fullerton. No military installations that I am aware of. Something at the University or local high school might be doing it, but the high school is a couple of blocks away, and the University is about 1/2 mile. If I were near there, I could bring one of my receivers and trace it down pretty quickly, but I'm 500 miles away.

A long time ago someone told me about the problems that can be caused by a garage door spring breaking under tension. There is a simple safety measure. Get some of the 3/16-inch stranded cable that is commonly sold at Lowe's, Home Depot, etc. Get four cable clamps. Run a length of cable through the center of each coil spring, the length of the spring. At each end, loop the cable through something -- there are usually holes in the door mounting frame -- and secure with the cable clamps. This way, if the coil spring snaps, it will not go anywhere because the cable will catch it. Otherwise, you'll have a big piece of coil spring shooting through the garage at almost the velocity of a bullet. Trust me, I know.

I could have worded that better. I meant that the coax is connected to the transceiver chassis but the transceiver's chassis is not connected to the car's chassis directly. I see why some folks took it to mean the coax braid at the transceiver isn't connected to anything.

Sorry for the confusion.

(snip)

Why would that be the best arrangement? No steady state power comes
from the battery. If you want the least voltage drop, you take a pair
of wires back to the alternator, where the power originates. The
only advantage of the battery connection might be lower alternator
rectifier noise in the power, but that is pretty easy to filter out
right at the alternator, before it gets out in the wiring harness and
into the antenna.

HUH???? I've designed enough communication site power
installations to know that the battery powers the equipment and the
function of the alternator in a vehicle or the rectifier (power
supply, in ham language) in a fixed intsallation is to recharge the
battery "on the fly", so to speak. The current capacity of the
battery is much greater than that os the charging device.

Any design that puts the load on the charging device rather than on
the battery would be rejected out of hand. At best. both of them
would be connectable (through switches or circuit breakers) to the
load bus, with separate metering for the battery, the charger, and
the load.

In your scheme the equipment would get no power when the alternator
is not operating, or more clearly, if the equipment DOES get power,
the power must be coming from the battery.

Think about it.

I've never heard of anyone hooking up auxiliary loads right at the
alternator. I can imagine somebody hooking a secondary-battery feed
at this point (in an RV, perhaps) but I don't think I've ever seen
radios hooked up there.

I rather strongly suspect that you'd find the amount of "alternator
whine" in the audio to be significant greater if you hook up the radio
right at the alternator.

Every mobile-ham-radio installation guide I've ever read (including
the owners' manuals) seems to recommend running heavy wires back to
the battery.

I have yet to see "any" manual which suggests going to the "Alternator" for
voltage to run a radio, be it Ham, CB, or Two Way or even just electronics
books which may touch the subject of wiring radios or anything else for that
matter - into vehicles. I don't know where this guy read his information,
I'd love to know where the idea came from. My gosh, the whine is bad enough

sometimes at the battery, let alone the Alternator - the mother of it. Most suggestions are to fuse both the positive and negative leads on the radio (going to the battery) - although you can get away often - with grounding the negative and fusing the positive to the battery (for best results) OR to some point to feed the 12 volts if the current supply is ample - ie the cigarette lighter or some other place people tend to use. "I" don't suggest that, but people do use them..... Of course - the latter would be for smaller hand held CBs or the like. Anything larger, you're pretty much left with only the Battery.

I don't recommend fusing only the hot side. Fuse both. It's safer.

Fusing the ground wire protects you against wiring faults. Consider
what would happen if you don't do this, and your radio's chassis is
grounded to the vehicle frame, and if the main grounding strap from
the alternator to the battery comes loose at the battery end. Your
rig's chassis, and its ground wire could end up being a major part of
the ground-return current from the alternator to the battery. The
ground wire may not be able to handle that much current, and might
overheat or catch fire. If it's properly fused, the fuse will blow.

I'm with you - I was just alluding to - in some cases, like CBs, people get
away with fusing only one lead. My personal opinion - fusing both sides is
the only way to go and most manuals I've read "do" suggest "both leads
fused".

I am using a Yaesu FT-857D. The power cord that comes with the radio is approx 8 feet long. At one end is the plug that matches the power jack on the radio. At the other end are TWO inline fuse connectors -- one in the red lead, one in the black lead -- with approx 10 inches of wire coming out of each fuse holder, bare at the end, to connect to the battery (or some other source of power). The inline fuse holders take standard automotive blade fuses. So -- it looks as though Yaesu intends for both positive and negative leads to be fused.

I have always subscribed to the fuse both leads theory too, but here
is what the Chrysler engineer's say about the installation of radio
transmitting equipment in all their vehicles:

"DO NOT FUSE THE GROUND LEAD. If the ground-side fuse were to open,
the entire supply current would be conducted by the coax shield. This
could cause the feedline to overheat with possible resulting damage."

~~~~~~

I think John is right, however I would never do it that way. The extra millivolts you pick up are going to be smothered in alternator noise and if large enough, might actually be too high for the radio. Radios are typically designed to run from 13.8 volts maximum, whereas alternators often put out more than that.

The additional few watts you get from your transmitter will not be noticeable in normal operation anyway.

I think that's the whole point. It's not the coax they are worried
about, but causing a fire in the vehicle from overheated coax is.
Usually, when manufacturers come up with these "rules" it's to

minimize litigation by the vehicle owners.

Well lets hope the new model will be more reliable than the Mark V.
I did not buy one because of all the complaints of both the 100 watt
version and expecially the 200 watt version blowing up and requiring
multiple trips to Yaesu repair.
I looked at the Kenwood TS-2000, but it is just too ugly. Multiple
eham.net reports also suggest that it is deaf. As far as the Icom's,
I look at an LCD screen on my computer all day at work. I really
don't want to look at another computer screen when I come home from
work and turn on my ham radio.

If you connect the radio's negative lead (unfused) to the car's chassis you should be ok. A problem can occur if you connect the radio's unfused negative lead directly to the battery terminal, as is often advised.

If the car's ground wire from the battery to the car's chassis ever comes loose and you go to start the car, all the starter current will try to flow through your radio's negative lead and through your coax to where the coax is grounded at the antenna feed point. I have seen pictures of what this several hundred amps does to a radio and it's not pretty.

Most radios today are supplied with a power cord having a fuse in each lead for good reason. Don't defeat their purpose.

This appears to be something that anyone with a saw and a few scraps
could make in half an hour. The "friction" mount and the rough fit and
finish contribute to this impression. What makes it worth $70?

The ads for the Kenwood TS2000 were not the best. I thought the same,
ugly. I bought one anyway because of all the stuff it will do and when
I got it and on the desk it's not all that bad looking. The pictures
aren't very good. It is quite a radio.

As for the MKV, I had one and it's got many on hours, hundreds in fact
and I never had any problem with mine, but that does not speak for
everybody, just me. Having said that, I did not find the MKV to be much
better than the MP. I like my 775 better.

I once made a service call to Automatic Door in Chicago. They had a newspaper article on their bulletin board about some unlucky guy who came home to find his garage door spring unwound. It seems he decided to fix it himself and while up on the ladder he got his necktie (another good reason to ban them) caught in the spring as it wound itself up. His wife tried to cut him down with scissors but was too late..

Read the installation manual for the opener. I installed a "Genie" at my last house. The logic for the wired button and the remote control are quite different. The door adjusts its speed and torque by learning from using the wired control. There is a torque sensor which detects blockage of the door as well. Again read the manual, it could be the installer does not RTFM!

Let's forget about the door, its springs and torque adjustments. This
is an RF problem! Neither a new remote nor the original remotes will
actuate either the new receiver or the old receiver. Has nothing to
do with the door itself or the closer. There is something near that
physical location that prevents the receivers from getting a valid
signal from the remotes. I am looking for ideas as to what that might
be. This is an all-house neighborhood. No businesses of any kind.
Nearest thing other than houses is a high school two blocks away.
Power lines are overhead, not buried.

I think you're going to have to find something that's capable of
acting as a spectrum analyzer (or at least a crudely-tuned RF
sensor/signal-strength-meter) and start DF'ing.

A ham HT with 70 cm capability, and a 'scan' feature, might be enough
to find the signal frequency fairly quickly if it's strong enough to
interfere with Part 15 devices. Then, start hunting. A simple
hold-it-near-the-chest-and-spin-on-your-heels 'body fade' might be
enough to allow you to triangulate in on the source.

A two- or three-element Yagi hooked to a real spectrum analyzer would
probably be rather faster.

I agree with you Dave. I have everything that would be needed to
trace out the interference. Unfortunately, I live 500 miles away. I
am trying to find ideas that I can offer to my 80 year-old aunt that
she can use in discussions with service people, utility companies,
etc. She is still very sharp, but lacks electronic experience.

I think you speak of the Ten Tec Scout 555, which was the 50 watt radio, or the Argo 556, which was identical, only just 5 watts.

If it is interference it could be from a number of different sources & finding that source without the right equipment (most garage door companies won't have this equipment) can sometimes be difficult.

Over the years I have seen interference from police scanners, ham radio's, large satellite dishes when pointed in a certain direction, cell phone towers, when a particular car was parked in the driveway (believe the interference was from the car alarm), and other garage door openers. Usually all of these items are relatively close to the problem location. I have also heard but never seen that a TV cable will also cause interference if not poperly grounded.

Within the last couple of years the military has been installing new radio equipment that stomps all frequencies in the 375-450 range and there are reports that this interference can range up to fifty miles from the military installation. For years the Chambelain, Liftmaster, Craftsman, Genie and others have been usuing the 390 frequency because of it's reliabilty before these new installations. Last spring the Chamberlain group of openers started using the 315 frequency to get away from this interference problem. I don't know off hand what Genie has done to remedy the problem.

About 6 months ago, most of Aruba started having interfernce problems quite suddenly (no one there knows where it is coming from) and the 315 frequency solved the problem there also.

With all of that said, as others have posted interference will not usually stop a closing door in mid travel. There may be some other issue there or it may be that your aunt is holding the button too long when she can't get the door to work & the opener actually ends up receiving more then one signal from the transmitter.

Usually for a door company it is easier to install new radio controls that are on a different frequency that will work in a certain area then it is to find the offending source. If it is a military installation, phone tower, etc there isn't a whole lot (if anything) a door company or a homeowner can do to stop the interference from happening & the only choice is to come up w/ a work around. It may sound like a cop out or bs excuse but as we produce & use more products that work on radio frequencies the interference problems are only going to continue to get worse. Therefore until someone comes up w/ something different or better we must learn to deal w/ it effectively & the best way to get the consumer a product that will work as it's designed.

Ten-Tec Scout. 50 watts, with a fairly popular aftermarket mod to provide a switchable 5-watt setting for QRP operation. PTO tuning, with a reputation for being a bit drifty over time especially during CW operation.

In my experience it's a pretty decent little radio - I have one in my Aerostar for HF-mobile operation.

It's no longer being manufactured, but Ten-Tec still sells the band modules and has some stock of replacement parts for it.

Thanks doordoc. That's what I was looking for. My aunt's door is not the one with the open halfway then close problem. That's across the street.. My aunt's won't operate at all with the remotes. The house beside her has the same no operation problem. I don't know how far this problem spreads in the neighborhood. She has already paid the original installer $120 to troubleshoot. The installer is convinced it is an interference problem. I am going to try to find out the make and model to see what I can learn about frequency, etc. If I can find out, I will post it here for comments.

Hey,

I am trying to find out the different Node numbers for repeaters worldwide.
My local 2m repeater is enabled for gettin other repeaters worldwide as i
have heard it beind done many times. Is there a website that has the numbers
or would one of ye be kind enough to provide me with the info.

Thanks,
Chris

<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5857659690>

Less than 3 days to go...

Available on eBay is a complete set of Motorola MX350S Synthesized, DES

Encrypted VHF radios. The system comes with a six position
charger/conditioner, batteries, manuals, RF test cable AND a DES
Keyloader. Because this system uses DES Encryption, it can only be
shipped to a U.S. address.

See eBay item #5857659690

Thanks,

S

Sorry, I thought we were talking about a vehicle electrical system. In a vehicle, the battery serves essentially one purpose, to start the engine. After that, everything runs from the alternator, which also recharges the battery over a period of time.

> The current capacity of the
> battery is much greater than that os the charging device.

Are we talking about a transmitter that draws more current than an alternator can supply? If so, I think it is a poor arrangement. I wouldn't connect a transmitter that exceeded the output capability of the alternator, even if it meant I had to upgrade the alternator t oavoid it. I also wouldn't install a tranceiver in a vehicle without adding an RFI filter to the alternator. If it is too noisy to be connected as the power source, then it is too noisy to have connected to the wiring harness, in such proximity of a receiving antenna.

> Any design that puts the load on the charging device rather than on
> the battery would be rejected out of hand.

Not by me, it wouldn't.

> At best. both of them
> would be connectable (through switches or circuit breakers) to the
> load bus, with separate metering for the battery, the charger, and
> the load.

In the automobiles I have experience with, the alternator connects directly to the power distribution bus with one branch of that bus going to the battery, as the recharge path. The battery also has a heavy connection directly to the starter relay, to start the engine, independent of that distribution system. Connecting a big load, whether headlights or transmitter directly to the battery will lower the battery voltage slightly, so that it does not recharge fully. All loads should branch from the alternator output, where the voltage is regulated, including the battery charging branch.

> In your scheme the equipment would get no power when the alternator
> is not operating, or more clearly, if the equipment DOES get power,
> the power must be coming from the battery.
> Think about it.

I'm thinking about it. You are saying that the transmitter draws more current than an alternator can deliver, with the engine running, but you intend to operate it without the engine running. I hope you pack jumper cables. ;-)

~~~~~~

Really? Then you should have an alternator which could supply the
starter motor too, with that thinking.

The battery is there as a power source for intermittent loads. Use it.

Have you ever driven a car with a totally dead battery, after starting it with jumper cables and running entirely off the alternator? I have and it's not good. The battery is there for more than just starting the car. It also stores and smoothes the output from the alternator, much like a giant filter capacitor. Don't be afraid to use it as such.

What you are suggesting flies in the face of everything I have ever
read on mobile radio installations over the past 55 years. In fact, I
would defy you to point to any engineering documentation that suggests
attachment of the radio power leads to the alternator vs directly to
the battery.

I described the separate wiring that allows large current draw from
the battery, intermittently, for starting.

Of course, you can use the battery in ways the auto manufacturer did
not intend. If you want to run a radio for long periods with the
motor off, you can expect the battery life to be shortened, though.
Auto batteries are not deep cycle designs.

Agreed. But I prefer to design and install my own alternator RFI
filter, rather than depend on the battery for that purpose.

Dick, I have been wrong lots of times, before, and would be happy to see valid arguments that shows me my errors, here. Unfortunately, arguments from numbers and authority are not valid arguments. Telling me that lots of peope dissagree with me is about as persuasive as telling me that my way is "not acceptable" with no reasons why.

Edumacate me.

The difference is the IR drop of the branch circuit from the power bus to the battery positive, including the fuse link in the harness.

Loading the battery for long periods when the alternator is running is likely (if the regulation point is at the power bus, not at the positive battery ternminal) to result in an under charged battery.

If the regulation point is the battery positive terminal, then the voltage at the distribution bus point will be pushed up to compensate for the unexpected IR drop in the battery branch, and will shorten the life of headlight and other bulbs. (The charging systen is designed so that the battery is normally recharged at a rather modest rate, not at the full alternator output capability.) This is a reason why the regulation point is usually at the distribution bus, not at the battery terminal.

I'm not sure it's possible. If I said that every authoritative
document I have read since I was born states that the world is round,
and you still insist that it is flat, there is nothing I can do to
convince you otherwise.

Good engineering practice has ALWAYS said that radio communication
power leads should go DIRECTLY to the battery. One document that I
would refer you to is the ARRL RFI Book. Direct battery connection is
mentioned several times. Engineers at the automobile manufacturers
EMC labs recommend direct connection to the battery. If you want to
read a detailed discussion on the subject, go here.
http://www.arrl.org/tis/info/rfiauto.html If numbers and authority
aren't valid arguments, then there is no point in trying to educate
you.

Dick

Sure you could, if you understood the basis of the popular belief that the world is round and could explain the facts (observations, measurements. logic) that support that popular belief. That iswhy science is so much more solid than religious dogma. Anyone with the interest and resources, but doubts, can go back to the original experiments and duplicate the observations and measurements that were used to build the logical framework of any part of scientific understanding. If you just study the conclusions and have no knowledge of how those conclusions were derived, you might as well be memorizing dogma.

Thank you. I will see what they have to say.

> If numbers and authority aren't valid arguments, then there is no point
> in trying to educate you.

So you have no understanding of why one way is better than another, except that there is a consensus of someone says so.

At least, I have presented my reasoning. I got an electrical engineering education, so I could wade into such reasoning. It certainly isn't infallible, or complete, but I do my best to think things through, logically, applying physical principles. If my knowledge or reasoning is faulty, tear it up.

I have been watching this message thread and I am in Dick's corner on
this one.

I have never never read anywhere, never heard anyone, advocate
connecting radio equipment directly to the alternator.

One thing, the battery functions somewhat as a big filter capacitor.
The alternator is designed to supply sufficient current so if everything
is going (lights, fan motor, radio, etc) there will be sufficient
current to supply it, however, there are times, such as starting the
car, you need the extra capacity of the battery. In as much as many
community water systems rely on storage tanks and do not draw directly
the well or stream they draw water from, an automobile battery is a
storage device for electricity. The various devices in the car draw off
the "storage tank" which is replenished by the alternator.

Adding other equipment such as a transmitter, could possibly overload
the alternator. Albeit temporary, the alternator could be strained to
its limits, where a battery could easily supply the necessary current on
a temporary basis and then get replenished by the alternator.

Years ago, ambulances had the old Federal "Q" mechanical siren. It took
several hundred amps to get that thing going. No alternator could

handle that. It was not unusual for headlights to dim noticeably when you started the siren. Even today, fire engines, with their beefed up electrical systems, heavy duty batteries, high output alternators, still get their lights dimmed when they start the "Q".

FWIW, I own a 1995 Ford Explorer which I bought new. About 2 months ago, I finally replaced the original factory battery. Even though the battery was still able to start the car, I noticed it seemed sluggish occasionally and figured that was my "warning". I have a VHF/UHF 35-50 watt mobile radio as well as a 100 watt HF mobile radio in it. Both radios are wired directly to the battery and fused on both leads. A few times, I inadvertently left the VHF radio on and over the period of a few days, ran the battery down to the point I had to reset the clock and radio stations. After jump starting the car and letting it run, the battery bounced back to life. I tried not to make a habit out of that, but things happen.

I had considered buying another battery and keeping it in the car, just to see how long the original battery would last, but it would be my luck, the time it crapped out, would be the time I needed to get somewhere in a hurry. I figured the original battery didn't owe me a thing.

I am with Dick on this one too, with ONE change, I have a dual battery setup. One is for the truck system, the other is the one I use to power my radios, and extra equipment(laptop, and networking test equipment). This way you will never run down your starter battery, and the equipment battery is a deep cycle dual purpose marine battery...

Depends on whether the battery is fully charged or not. Immediately after starting the engine, the voltage difference will be at its greatest. After a few minutes running, the difference will be very small, unless a large current drain is occurring.

In other words, there is no single answer.

I have read through this page, and it contains what you say it does. Unfortunately for my education, the manufacturer's recommendations do not give any reasons for their recommendations, so you have no way of knowing if it makes the radio work best, or just protects the automotive electronics most from interferrance from the radio, or even if they thought much at all about the question, but just gave the first answer they thought of. I doubt very much that they are at all concerned with your radio working, optimally.

Further down in the discussion section, the manufacturer's recommendations are echoed several times, but the reasons given are related to avoiding specific problems. So here is whai I found:

(begin excerpt)

Q: When I'm installing the radio, where should I connect the dc power leads?

A: The positive and negative leads from the transceiver should connect directly to the battery with fuses in both leads. Route them away from any
other wiring in the vehicle. This usually means drilling a small hole in the
firewall between the engine and the passenger compartment and running the
wires through a rubber grommet (to protect their insulation from sharp edges). If the wiring or antenna lead must pass near vehicle wiring, route
it at right angles to the wiring. It is best to run the power and antenna
leads as close to the vehicle chassis as possible.
(end excerpt)

This is essentially an echo with not much reasoning. Do it this way because (they, we) I say so.

(begin excerpt)
Q: Why can't I find power inside the ear?

A: It's often difficult, especially in modern cars, to know which power sources in the passenger compartment can safely carry the high-current loads
of a transceiver. If you choose a source that also powers one of the microprocessors, the transmit current could cause problems. In addition, some
transmitters are not well bypassed and some RF energy can appear on the power
leads. This is bad news for microprocessors. Even grounding isn't as simple
as it seems. With all of the plastics used in modern vehicles, not everything
that looks like ground is really ground. It could be "floating" or even be
part of the wiring for one of the vehicle's sensors. Even if you do tie into
the chassis, it is possible that the section you've chosen forms part of the
return path for one of the control modules Generally, you're better off running the wires to the battery, especially for high-power installations.
(end excerpt)

Now, here we have a couple reasons why it is not recommended to just tap into the existing power distribution wiring.

1. Exceeding ampacity of the wiring.

2. RF leakqage out the radio power wires interferring with the automotive electronics

3. Chassis as ground return coupling noise between radio and car electronics.

All good points. None contradict my idea, except, possibly 2. But the RFI filter I suggest adding to the alternator can bypass this noise. Beefing up the noise immunity of the power bus seems like an excellent idea if you are going to add a powerful RF generator to any modern vehicle, whether the radio requires it, or not.

(begin excerpt)
Q: My VHF installation works perfectly. However, I followed similar guidelines for HF and found that I had some pretty strong noise on receive.
Some of this noise goes away when I connect the radio to the test battery I
used earlier. Any ideas?

A: It sounds like some of the noise is coming down the power leads. To cure
this, first try ferrite chokes on the positive and negative leads. Obtain two
FT-140-43 ferrite cores [2] and wrap about 10 turns of each wire onto

the
core. (Fewer turns may not work, and if you substitute a different
ferrite,
make sure it's suitable for HF - unknown materials usually don't work!)
You
can also try installing 0.01-uF capacitors from the positive lead to
the
negative lead, or from the positive lead to chassis ground (or both).
The
capacitors may work best with or without one or both of the ferrites.
(end excerpt

This is a very brief discussion of filters between the power source
and radio. I would like to see a much more scientific expansion of
this topic. There are lots of things to know about making effective,
high current RiI filters, especially ones that must carry large DC
currents. It does imply that a battery is not necessarily an effective
bypass capacitor at RF frequencies.

I still see nothing about why it is so important to connect directly to
the battery, instead of to the power source that maintains battery
voltage, except that people say to do it. It is beginning to look like
common wisdom that may actually be based mostly on a commonly held myth.

> the "storage tank" which is replenished by the alternator.

The alternator and battery are connected by a piece of wire (often
including a fusible link to act as a fuse, in case the alternator
rectifiers short, to prevent fire).

The battery can act almost exactly the same as a reservoir from the far
end of this wire as it can with a more direct connection. The
difference being that a direct connection lowers the effective charging
voltage by the amount of the connecting wire IR drop while the radio is
drawing current. If the radio is connected at the alternator end of
that wire, the alternator and battery provide current to the radio
through two parallel paths, rather than the total radio current having
to pass through the alternator-battery link. If the alternator
regulation keeps up with the radio load, the battery will provide
nothing except for ripple filtering, and stay fully charged.

> Adding other equipment such as a transmitter, could possibly overload
> the alternator.

The alternator provides the current, whether the radio is drawing it
through the battery charging branch or not.

> Albeit temporary, the alternator could be strained to
> its limits, where a battery could easily supply the necessary current on
> a temporary basis and then get replenished by the alternator.
(snip remaining personal account that addresses other problems)

The alternator and battery are connected together by a fraction of an ohm. The alternator doesn't appreciate the difference (of where the radio is connected). The battery and radio might.

You said you have an engineering education. I am a graduate of a major university, but in management, not engineering. In my past life, I ran companies that had people from many engineering disciplines. Major corporations in the aerospace field, with test labs, calibration labs, etc. If I had questioned every paragraph in every text book during my entire education, I would never have graduated. I would still be trying to second guess the authors.

I have a friend who has an BSEE from Cal Poly and an MSEE from UCLA. He is a brilliant engineer and former ham who has owned two electronic companies. If he told me that I should attach my radio to my battery I would just do it. I would not ask him for all the engineering reasons why that is a good idea. I might question him out of curiosity, but I would still accept his knowledge as fact. That's where the authority comes in. If you can't accept hundreds, if not thousands of engineers who would tell you that it is not optimum to attach your radio to the alternator, then you will probably never get anything done in your life. You will always be questioning everything and never accepting the written works of recognized authorities in the field.

Dick

Thank you for describing your approach to and qualifications for taking
part in a technical discussion. If you only have access to authority,
and little understanding, I guess that is what you go with.

But I have always wanted to know the actual reasons why, for everything
I work with. That means that I have been working continuously on my
education, since I took an interest in all things electrical about 45
years ago. And you are right that it is a lot of work and really
slows down my arrival at many decisions. I have to keep going back to
the basics and working my way through all the science necessary, when I
break into a branch of engineering that I haven't previously covered in
detail, even if it is only a variation that alters a few of the basic

assumptions inherent in a previous conclusion. Of course, this approach means that I also welcome correction, when it is well reasoned. I jumped into this discussion, not not because I am an expert with endless experience and knowledge, but because my understanding seems to be at odds with the common wisdom. I hope that either I learn something I have missed, or I help to expand a few people's understanding beyond common knowledge (which is often wrong in some fundamental way {it was common knowledge for a very long time that the Earth was flat} or over simplified). Reality is complicated.

Okay, enough phylosophy. Back to the discussion, please.

So what happens when the fusible link fails and the alternator does not see a battery at the other end? Is there a voltage spike that could damage equipment?

Another advantage is not electrical in nature, but pure common sense. I am fusing my leads close to the power source. With todays vehicles engine compartments crammed full of compressors, pumps, drive belts, pulleys, etc, why would I want to dig down in all of that stuff, when most battery or power points are sitting right there in easy reach? My wife's car, she just sold, is a 1996 Monte Carol Z34. As I recall, you had to take one of the front wheels off, to access the alternator.

Some vehicles I see today have factory installed power points under the hood, specifically for any aftermarket accessories.

Quite possibly, including the equipment that runs the automobile. This
fault is expected onlt if the alternator short circuits. The fuse link
is generally quite robust and only fused by a short across the
battery, through it.

> Another advantage is not electrical in nature, but pure common sense. I

I admit that doing it right may not be the most convenient way of doing
it. And I have no problem if you do it the convenient way, instead of
the best way, as long as you understand the compromises you are making.

> My wife's car, she just sold, is a 1996 Monte Carol Z34. As I recall,

Oh goody, we get to play the voir dire game, the one I love to do
with opposing-side "experts".

Where did you get your degree?

In what states are you a Registered Professional Engineer?

What is your experience in fixed and mobile power system design?

How much experience do you have in hands-on installation, testing,
and evaluation of such power installations?

This doesn't even get into question of whether your scheme is
accepted best engineering practice in the industry.

Do you accept that the world is round or are you prepared to
explain why Christopher Columbus' fourth ship fall over the edge?

My qualifications are a matter of record in the industry. Are
yours?

The battery is not there to filter RFI - it's there to smooth out
any ripples in the rectified but unfiltered alternator output in the
AF range. AFAIK no automotive alternator has any internal filtering,
and the battery is the best way to provide that filtering as compared
to conventional lumped-constant LC filters.

Ten years on the original battery? What's your secret?? !!

Conventional wisdom backed up by experience says that a "X-year"
automotive battery is not expected to last more than that time if it
even makes it to that point. I've replaced a lot in family and
"work" cars. I even have to replace my gel-cells - which are on
continuous float per manufacturers specs - every four years whether
I am ready to do so or not.

>Even though the battery was still able to start the car, I noticed it
>seemed sluggish occasionally and figured that was my "warning".

The "warning" that most of us heed too late. I have the AAA Road
Service on speed-dial but I would rather not use it!!

I used to have a VW Bug (the original, not the latter-years
"wannabe") where those symptoms usually meant it was time to
replace the starter motor brushes. I found out the hard way that
"refurbishers" usually only replaced the one brush that was worn so
I started replacing both myself and problems went away.

Have you considered a dual-battery system through a battery isolator?
Leave the automotive loads on the auto battery, and put the radio
loads on a deep-cycle marine battery (don't use a gel-cell -- they
can't stand the heat build-up under the hood or inside a vehicle
parked in the sun). In all the communication vehicles which we
have constructed, we install professional vehicle alarms (not the
usual "screamers") running from this second battery which is
installed in a difficult-to-get-to protected area of the vehicle. We
do this even if there is an auxiliary AC generator installed.

Have fun.

How am I to know either the branch wiring resistance between the
alternator and the battery in your car, or the current you intend to
draw from the battery while the alternator is running? Some have been
talking about drawing more current than the alternator can supply.

The battery is definitely a part of any alternator filter. But putting a good high frequency capacitor right on the alternator output terminal to the case, and an inductor rated for full alternator output current between the alternator and distribution system (to which the battery is connected) and a second RF bypass at the distribution branching point, back to the alternator case, to block any RF leakage exiting the transceiver supply leads from getting out into the wiring harness, provides a huge reduction of rectifier recovery generated RF (through both the transceiver power leads and from direct radiation from the wiring harness) and 3 phase rectification generated ripple.

That is my run on sentence for today.

The battery is the low frequency part of the output capacitor in this pi filter.

It just seems strange to me to invest all that money in a powerful transceiver and a custom installation and skip these three vital parts.

I spent 27 years in the (volunteer) fire service and been out many a
night on an alarm, mashing down on the floor button, watching the
headlights dim....and that was with the heavy duty truck batteries and
the heavy alternator. Had a few occasions when the "Q" relay or foot
switch stuck "on". I found that quite annoying.

I have even seen a "Q" take the voltage down far enough for the radio
PLL to unlock.

Now THAT is stupid!!(not you....the rebuilders) When you have anything torn down to that degree and just replace ONE expendable component when a very minor cost would let you replace both (or all). Kinda like rebuiding an engine and only replacing the rings on ONE cylinder. When you stop and think about it, both brushes have exactly the same amount of time on them (assuming a new motor), so it would stand to reason, the other brush wouldn't have much more time to go before it failed also. Of course, perhaps the rebuilders may want to get you in to charge you a second rebuild charge in 6 months or a year.

I have not considered a dual battery system. I think my setup is basic enough I can manage OK without a dual system, but I can certainly see some advantages in certain applications (RV, Mobile Command Posts, etc). I think I would have a difficult time finding a place under the hood for a decent marine battery.

I am not arguing that the answer to any or all of those questions is
why you should consider my proposal. I only mentioned my degree as
part of the explanation of why this discussion interests me.

I am giving a physical argument to support my opinion. It may not be
correct, but it is an actual argument.

> Do you accept that the world is round or are you prepared to

I accept that the world is round, because I follow the observations and
logic that have made that the only supportable opinion to have.

> My qualifications are a matter of record in the industry. Are
> yours?

Do those qualifications mean that you cannot ever be wrong about
anything technical? Are your qualifications the entirety of your
argument, or do you have something specific and physical to add?

I see no compromise. The purpose of fusing a lead close to the source
is for protection against a short circuit and fire. If the fuse is
buried down in so much mechanical equipment you can't easily access, it
starts defeating its own secondary purpose of ease of replacement while
providing protection. If you fuse a lead close to an alternator that is
buried down in an engine compartment that requires 2 hours labor and a
handful of wrenches, then that is a poor installation.

Which is why I paid a garage to do it. As I recall, I think they even
had to loosen an engine mount and jack the engine up some....its been

quite a few years and I'm a bit foggy on some of those details, but I remember it was NOT something I wanted to attempt.

Agreed. Perhaps the design engineers are listening after all.
One thing I have noticed with the vehicle interiors. The ALL seem to have dashboards and center consoles that join together and make for the actual mounting of a radio quite difficult. Not nearly as easy as when you could just hang a bracket under the dash. For this reason, I have been accumulating various separation kits, etc, for my radio(s). I think it would be much easier to mount a control head and remote the main unit in some of the newer vehicles.

So you are fine with people who who work for you, doing illogical things they don't understand, without question, as long as it corresponds with your interpretation of the authorities. Don't expect me to come to you looking for work. I get paid to think.

The National Electrical Code goes to considerable effort to explain why its rules are logical and reasonable, and based on sound scientific principles supported by wide application experience. If you study the code, it is very difficult to find totally arbitrary or unexplained rules. The code is a great study in applied electrical physics.

Great. You have prioritized the potential problems and put this one at
the top.

I can see where a burried alternator might shift your priorities. But
the normal power distribution point is not buried, but readily
accessable.

I apologize for giving you that false impression.
This group appears loaded with those, and has no need for another.
I was being a person who had an opinion for some particular and stated
reasons, and was challenging this group to show me my mistakes.

No joy, so far.

What I have gotten is lots of "Thats not the way we do it.", "That's
not the way the experts say to do it." "You are wrong." and "I know
more than you do."

But back to your question, I assumed that you are qualified to measure
the wiring resistance between your alternator and battery and also
calculate (or read the manual for) the supply current of your radio,
and know ohm's law. So you should be able to tell me the difference
in the voltage between your alternator and battery. You might also
estimate what the ampacity of that branch wire (with fusible link) is,
based on the wire gauge of the link. If that current is anything near
your radio's draw, you might worry about operating your radio through
that link, especially right after starting the engine, when the
battery is recharging through it, also. Replacing that piece of wire
is an onerous task in many cars.

So nice for you!

Well, that is one hypothetical problem with my suggestion that doesn't
apply to those 3 or 4 vehicles. Perhaps car makers have had to reduce
alternator noise (e.g. use soft recovery diode bridges) to serve the
built in receivers and all the other electronics.

I have never seen it recommended to connect a radio to anywhere but at
the battery terminals. Even if the radio were to be connected to a
junction box designed for this purpose some distance from the battery
you never want the alternator to connect to that same junction. Having
anything connected to the wire carrying alternator current will induce
noise into that power line due to the resistance of the alternator
charging wire.

Most wires coming from the alternator to the battery are rather small,
#10 or #8 wire at best. There is significant voltage drop in that

wire. The noise from the alternator is not just from the average current causing a voltage drop but from the peak current which is much higher.

Every time you turn on the headlights the noise will get worse if the radio is connected directly to the alternator because of additional voltage drop on that line.
If there should be a break in the alternator wire to the battery the surge from the alternator will most likely damage the radio.

The alternator regulator most likely would not be able to handle the rapidly changing load of an SSB radio smoothly causing additional spikes as it tries to regulate.

Need more reasons? :>)

A more common problem I'd be concerned about would be "load dump",
which occurs when a high-amperage load on the car's electrical bus
stops drawing current abruptly - for example, if the headlights are
switched off while the engine's running. It's common for this to
result in a large voltage spike out of the alternator, before the
regulator has time to reduce the alternator output. Spikes of several
dozen volts are common - my recollection is that auto-electronics
manufacturers engineer their devices to be able to stand 50 volts at
their power-supply terminals for a brief moment.

I would expect that the magnitude of this spike would be significantly
greater at the alternator terminals, than it is at the battery, due to
the series resistance and series inductance of the battery-to-
alternator cable, and the battery's low impedance. It's possible that
a load (e.g. radio) which could survive a load-dump spike if wired to
the battery, could be damaged by a higher-amplitude spike from the
same load-dump event which might occur right at the alternator.

It seems clear that the standard, recommended practice is to wire
radios to the battery. It also seems that the original poster is not
satisfied with the justification for this practice (either by
convention, recommendation of authority, or theoretical arguments
posed to far), and that he has some arguments from first principles
which he feels justify a different approach (wiring to the alternator).

In the end, for the original poster to be satisfied (either that
standard practice is the best practice, or that his alternate
suggestion of wiring directly across the alternator is actually
superior) I suspect that he's going to have to fall back on that old
mainstay of scientific discovery - he's going to have to experiment.

He'll have to wire several different radios, of various makes and
models, up to [1] a double-fused heavy-gauge feed from the battery
posts, and [2] an equivalent feed brought back to alternator and its
ground. He can then determine whether his alternate approach actually
delivers more useful current to the radio, whether the transmitter

powers are actually higher, whether there is indeed more alternator whine or RFI on the transmitted signal or the received audio, and whether the radios show any differential in their ability to survive a few months of usage and load-dump spikes without losing their Magic Blue Smoke.

Actual results (either way) trump speculative arguments.

I know of a guy who had an HF radio fry when the voltage to it exceeded 16 VDC - not once, but twice - doing some major damage (a few parts and lots of dollars). He didn't know what caused it the first time to protect it before the second. He thought it was just a fluke (the first time). The point is, anything beyond the rated 13.8 was running a risk - even if accidental. And as argued in previous posts, the whine coming straight from the mother of it - has to be a bear.

I would like to know - where this idea hails from - to begin with, how long "John" has been doing it, how many radios and/or alternators fried from it.

Also, I don't think any or all of us are saying we're all right and you - "John" - are all wrong. It just seems NONE OF US - have ever heard of this being done. WHERE - what book, teacher, etc - got you on the track of doing it this way???? We just all (except you) seem to be in agreement with the way "we" were taught. Maybe you could think of it as say - John Glenn explaining flying a rocket to a cave man. The concept new - unheard of. Not that it hasn't been done - you've said so yourself, ya got to be a good "salesman" to get it across to the masses who've yet to see. You have to know - anything "new" - be it a new drug to fight disease, technique to do surgery quicker and less painless - or Electronics techniques or measurements - will meet resistance until proven.

Maybe - if any of you out there have access to a junk car that runs yet, and you're not afraid to experiment, can grab some junk (but working CBs/2 way radios) - give it a whirl and report back with your own test results. As Dave Platt said in the post above - "Actual results (either way) trump speculative arguments."
I don't have a junk car to try it with..... Maybe I'll go to a junk yard and try to pick one up cheap..... try it a few times. I'd love to see how this works - maybe I can become a believer.

It might well have been the load dump phenomenon Dave described. The cause of load dump is that at any given time, the alternator contains quite a bit of energy. If a good part of the load is abruptly removed from the alternator, the energy is "dumped" into whatever is left connected to it. The result can be several tens of volts or more, with the capability of supplying a lot of current. A common cause of load dump is loose battery terminals, and this might be what happened to the fellow with the blown rigs. The safest thing is to connect the rig directly to the battery posts, not the connectors or connecting wires. Long ago I bought and built a Heathkit SSB mobile rig, and I recall drilling holes in the ends of the battery posts and (gently) driving in some special terminals that came with the mobile supply.

I'll join the chorus in recommending against connecting a rig anywhere but at the battery, and add my recommendation that the connection be made directly to the posts. As several others have said, the battery does much more than start the car. Without it you've got a very nasty supply with the potential to do serious damage.

An additional reason to connect to a point with the lowest Thev. equiv. resistance (battery terminals) has to do with turning off inductive loads. A student of mine told me he once measured just over -100 volts on the line to a windshield wiper motor when the motor was turned off at just the right time. (Storage scopes are desirable.) That system was not put into production.

Another story has to do with the turret motor in a tank. When the turret stopped rotating the resultant voltage spike would destroy all of the tank's electronics. (Talk about concentrating one's mind!) The temporary solution - since the problem was discovered late - was to buy huge zener diodes from Delco Radio (as it was then called) and place them across the 28 volt line.

Thank you for discussing principles and effects.

Agreed, that the alternator does not produce pure DC, so the voltage
will not be quite as quiet as it is at the other end of the several
feet of wire that connects to the battery positive. (But to paraphrase
Ceeil Moore's question to me, earlier) Do you have any idea,
quantitively how much voltage you are talking about? THe ripple
current in the output of the alternator sjhould be a few percent of the
DC, at most, with some high frequency pings caused by rectifier reverse
recovery. Adding a rather small PI filter is very effective at
reducing all this no a much lower value. And the small charging branch
to the battery cuts the other way, also. If you draw significant
current from the battery, the battery's voltage is held lower than the
alternator voltage by the IR drop of that wire. And that drop lowers

the charge state of the battery.

> Every time you turn on the headlights the noise will get worse if the
> radio is connected directly to the alternator because of additional
> voltage drop on that line.
> If there should be a break in the alternator wire to the battery the
> surge from the alternator will most likely damage the radio.

Now, you may just have hit upon the one factor that trumps every other minor effect. Unfortunately, the most common cause of load dump voltage damage to automotive electronics is caused by a loose battery terminal. So, till you solve that problem, you are not gaining much insurance by moving your connections to the battery terminal.

> The alternator regulator most likely would not be able to handle the
> rapidly changing load of an SSB radio smoothly causing additional
> spikes as it tries to regulate.

Is any radio not equiped with input bypass capacitors? I am skeptical. If this were the case, the radio would not tolerate feet of wire in the power circuit. Do you have a schematic of any DC powered radio that does not show some storage at the DC power input?

Again, we are not talking about powering from an alternator with no battery attached (except for a terminal comng off the battery), only moving the power point to the other end of the battery charging branch wire (that 2 or 3 feet of 10 gauge wire you mentioned earlier (with, possibly a fuse link section in it) so that the average current arrives from the alternator, and only a stabilizing effect on the ripple arrives from the battery through that wire.

> Need more reasons? :>)

Who knows? If you got 'em, I am happy to think about 'em.

I want to thank you, again, for taking time to think (in print) about what is going on in this system and what can go wrong. This has been helpful.

> their power-supply terminals for a brief moment.

This is an effect that is well worth discussing and understanding,
thoroughly.
The load dump (with battery connected) would be a very slight thing,
if the alternator could react instantaneously to load changes. But
like any feedback control system, it has a maximum frequency that it
can react. The electronic excitation regulator is quite fast at
detecting the slight rise in system voltage following a load reduction
(headlights turned off), but the magnetic field around the rotor takes
more time to decay after the excitation regulator decides to cut its
current. During that time, the alternator ramps its output current
down from what the load curent was before the dump to what it is after
the dump. So there is a few 10s of milliseconds when the battery has
to absorb the extra current. And that pushes the voltage across it up.
The opposite effect occurs (and worse because ocold filaments draw
almost 10 times the normal current) when the headlights are first
turned on. There is also a wiring system inductive effect that adds an
additional but very brief (microseconds) peak to each of those
excursions.

> I would expect that the magnitude of this spike would be significantly

> which he feels justify a different approach (wiring to the alternator).

I want to understand why the recommended way is best, all things considered. I see some positives and some negatives, and judged, on balance that the "normal" way was not necessarily the best way. But, the load dump factor may outweigh all the others, if it causes damage. I'm not so sure it does, but this diuscussion is helping me weigh it.

> In the end, for the original poster to be satisfied (either that

All the principles involved should include only known science. As long as I don't miss anything, the probvlem should be solvable without reinventing electrical principles by experiment. But a few accurate measurements of the voltage spikes at both the battery terminals and DC bus distribution point are probably not a bad idea, in any particular car.

Thank you for supplying an important missing piece of this puzzle.
I would add that if your battery starts to get a little flakey and the
voltage is sagging pretty low during starting, you can have a large
increase in the load dump voltage at the battery, even if you have made
the seperate connections you describe, just because of the increase in
the battery impedance.

One of the most common electrical system problem in cars is loose
battery terminals, and I'll bet not one person in a hundred, that
installs separate leads to the battery, terminates them as you
describe. So when I hear stories of a load dump causing damage, I
always wonder about how clean and tight those terminals were.

I replaced my original equipment GMC pickup battery with
a Sears Die-Hard with four ternmials. Two of the terminals
are the standard GMC terminals on the side and two of the
terminals are old-style posts on top. I tie my transceiver
to the two posts on top.

Neat idea!

I've noticed that some of the Optima batteries (e.g. the blue-top
dual-application type) come with two sets of battery posts - standard
car-type posts, and smaller (threaded - SAE?) studs. Might be a good
idea to connect radios to the threaded studs, using heavy-duty ring
terminals on the ends of the wires.

Most radios do not have much for DC line filtering in them. Maybe a
500 to 1000 mfd cap if that. With a current draw of around 20 amps for
the typical transmitter 1000 mfd is not much capacitance at 12 volts.

As to the "load dump" problem, when the radio draw swings from around
1 amp to 20 amps at an audio rate I have to believe that the
alternator regulator would have a hard time keeping up and not
allowing overshoot or holes in the supply current.

Alternator filters can help filter out alternator noise but some times
they fail to do so even when the radio is fed directly from the
battery.

I have one ancient but probably still valid reference to alternator load dump. It indicates that it can be simulated by connecting a 6000 uF capacitor charged to 120 volts to the system. The result is a 120 volt spike with a decay time of several tens of ms. (The reference doesn't show the load current or impedance, but presumably this is with a typical automotive load and wiring system.) It also shows how a so-called "'A' line filter" -- an L network of 200 - 400 uH and 1000 uF reduces the peak voltage to a mere 40 volts but with a stretched decay time. The conclusion is that robust automotive electronic devices should be able to withstand this. I got this from an app note for a National audio amplifier IC which was designed to be used in automotive applications and so can withstand momentary 40 volt spikes.

(snip)

If I had a radio that had a 20 ampere power swing through the supply leads at audio frequencys, I would consider it a poor choice to run those power leads more than a few inches without adding some serious storage at the radio end of the wires, just to reduce the IR (reduce peak amps to something closer to average) and inductive drop of the power wires. The same applies to an audio amplifier of similar current draw. It is very common for large audio amplifiers to have serious capacitance at their end of the power wires. This also reduces the peak voltage during a load dump.

Ken Kuhlman, former "General Products" Heathkit engineer died of kidney
cancer on January 24th.

Ken grew up in Kansas and developed a deep love for electronics as a teen.
While he never got a ham ticket, one of the first electronic projects he
built was an operating telegraph system running between his and his
brother's tree houses. He graduated from Wichita State University with a
BSEE degree in 1964, and worked at Heath for over 25 years.

During his tenure he developed many very popular kits such as the GR-1075
Digital
Clock Radio and also contributed to the automotive products group, as well
as testing and development of the Heath/Zenith laptop computer products. He
was an avid car fan and had restored a 1957 Austin Healey, which he loved to
drive around on any warm day with the top down.

I was privileged to work with Ken a little at Heath, and for several years
shared office and lab space with him at Whirlpool. Ken always commanded
respect for his knowledge of most anything electronic. He retired in 2002,
but returned a couple of times a year to keep up and say HI. He will be
greatly missed by all of his friends, wife Judy, kids Tom and Molly, and 3
grandkids.

Doesn't seem too amazing to me. I have a clock just like that working
perfectly. As does all my Heathkit equipment no matter what the age.
We even have a Heathkit bathroom scale that we use every day. Built
it about 25 years ago. If you take care of them, I think they will
last forever.

Dick

I have owned this radio for many years having bought it new. I had planned on installing it into my isuzu trooper but never actually managed to get around to it. It has had no more than three to four total hours of use, if that. I has mainly been sitting on a shelf waiting to be installed. It has never been installed in a car and the little use it has had was on the bench with a bench top supply. It is in excellent condition with everything except the original box.

Asking $225.00

Contact me at pwborders at cox dot net

I have had this radio for a few years. I bought it new at a local hamfest. It is a very solid and reliable performer. Not overly complicated like some of the newer HT's but with all the features you could ever want in an HT. I have used it very little, probably not more then 15 hours total, mainly monitoring. It is in excellent shape and everything works perfectly. The memory expansion module ME-1 is installed as well. The batteries are a little old but have very little use so a few charge / discharge cycles may bring them back to full capacity. No guarentee on the batteries though since they are a little old.

Includes

* Kenwood TH28a Handheld Radio
* Rubber Jack Cover
* Lanyard
* Belt Clip
* Original Rubber Ducky Antenna
* PB13 7.2v 700mah Battery
* BC-14 AC Adaptor / Charger
* Original Manual

Extras

* ME-1 Memory Expansion Module
* W & W Associates:
o 2 - PB18 7.2v 1500 Mah Batteries
o Master Charger I With:
+ AC Adaptor
+ Kenwood PB Battery Cup
+ Icom BP Battery Cup
+ Yaesu FNB Battery Cup
* MFJ 287 Mini Speaker Mic
* DC 12v Car Cord
* BT8 6 AA Battery Case
* UPC-8 HT Cradle and 8" Pedestal
* Car Window Holder for Belt Clip Radio and Mic

Years ago I had a car where the battery terminals came loose every
couple of weeks, despite tightening the clamps to a fare-thee-well. I
couldn't figure out why until a very car-smart friend pointed out the
clamp that held the battery was loose. Normal road vibration caused the
battery to wiggle around just enough to loosen the clamps.

A word to the wise.

Here's another.

I once had a battery with a very slight leak around one of the posts,
and the terminal kept corroding and making poor contact. I took the
terminals lose, cleaned everything with baking soda, rinsed and dried
all the parts then sanded the posts and inside of the clamps to get a
fresh lead surface.

Here is the tip. I coated both surfaces with a film of heavy silicon
grease (Dow 111, or similar) and re clamped the terminals, squeezing
out the excess grease as the clamps tightened. Even though the
outside of the terminals still got visibly corroded the connection
remained perfect till the battery failed a couple years later. I have
pretreated every battery, when new, ever since, and have never had a
connection problem. The grease completely seals out moisture, acid
and oxygen, but is about as easy as air for the lead surfaces to break
through to make perfect contact.

I see that some headlight bulbs now come pre-glopped with a dollop of
such grease to protect the wiring terminals from moisture.

WD-40 also works quite well, as it penetrates and lubricates, and there is less mess. I run dual Optima yellow tops in my Wrangler, and a heavy duty conventional (normal maintenance) battery in my XYL's Grand Cherokee and in my Cherokee, and WD-40 has kept corrosion off of the terminal for years now. Works much better than the soaked red and black corrosion inhibiting felt rings. Just a thought...

Keep the bolts tight. Don't forget to run a heavy enough gauge fused wire pair to the rig to make up for voltage drop over your run length (lest you end up with a 30A load dropping the voltage to 10 or 11V and diminished RF output). Your rig was designed to operate as rated at

13.8VDC. With the engine off, you might get 12VDC. With too light a gauge of wire in a long run, you'll see your display dim or go out as the voltage to the rig drops below the minimum required voltage at the radio when keyed.

73,

Doug, N6XQY
Garden Grove, CA.

When I get a battery terminal with the corrosion and oxidation on it, I
sometimes pour a small quantity of Coca Cola on it. Cleans them right
off. I will then put a small amount of conductive grease on it.

Your education might not help.

My wife and I own a half-dozen VHF/UHF mobiles and 3 HF rigs. The manuals for each/every one of them say they should be connected directly to the battery if used in an automobile. That's a fact. They do say that.

Why? Now that's conjectural! Whatever anyone says, except the authors, is merely that persons guess.

I suspect it has more to do with human 'engineering' than any electrical reason. There are any number of ways to hook up a radio in most cars, including via the cigar lighter. The arguement about exceeding alternator output is grasping at straws - I know of no modern mobile that draws more than the 45 (and more) Amps supplied by even 'wimpy car' alternators.

OTOH, If every ham who buys a radio tried to connect them to the main power bus of a variety of cars then some of them would do it wrong, let the smoke out of something, and blame the radio manufacturer. But, connecting directly to the battery is generally so easy that even modern "appliance" hams can do it without burning up their cars. So the mfgrs take the easy safe way out.

But that is just my opinion - no better founded than many others.

433. Yaesu FT-857D question

Newsgroup: rec.radio.amateur.equipment
Date: 2006-01-31 22:33:31 UTC
From: "Joe S." <anon@mous.com>
Message-ID: <SvSdnZa0V9pYeELenZ2dnUVZ_sKdnZ2d@comcast.com>
Source record: 11269

I just completed the installation of an FT-857 in my truck. My previous 857 and truck were lost in Hurricane Katrina.

This installation went along just fine but something is not happening.

I set up the antenna menu for the rig to use the ATAS-120 on HF and 6; I use two antennas -- the ATAS-120 on HF and 6, and a dual-bander on UHF-VHF. I went through all the setup steps according to the manual.

As I recall, when I changed bands, or when I moved more than approx 10khz on HF, when I hit the PTT button, the display said WAIT until the ATAS-120 tuned itself then the rig transmitted. It's not doing that -- I can copy signals and the ATAS-120 seems to be tuning, but, when I try to transmit, the display says SWR and I don't see any power output -- and, I don't see the WAIT indicating it's telling me that it's tuning the antenna.

Can someone help me out here?

Thanks.

By way of clarification: If I select menu option K (I think it's K) and hit
the A (TUNE) button, the antenna will tune -- the display shows WAIT and the
meter indicates high SWR which eventually is tuned out, then the display
goes back to the frequency I was on. Thus, I can tune the ATAS-120 by
leaving the righ on option K and hitting the A (TUNE) button when I change
bands of move freqs.

As I recall, the radio I lost in Katrina did this automatically.

Thanks.

I'vw been around, but in keeping with what The Uncle used taxpayer money to train me to do well, I do a lot more "listening" than "talking".

When I did the 12V installation at home six years ago, my wife - who is a power utilities engineer - demanded that the installation meet not only UL specs but USCG specs for low-voltage marine installations. That automatically raised the cost by more than double, but it sure looks purty, especially the digital metering and LED circuit status indicators, everything on breakers, the whole bit. The gel-cell battery is in a plastic "doghouse" outside and I do have dual chargers/standby supplies "inside". I had to find a good source for 4 AWG "zip" cord and wound up using automotive jumper cables with suitable terminals crimped on (I do have the large crimp tools....). I understand now that that size may now be availavle at high-end auto sound shops. I do miss the big barrel of welding cable that I carted around for decades and finally disposed of ten years ago.

Now if I could only convince her that we really need that 48 KW (240V, 200 A) natural-gas-fired Genset that I've had my eye on.....all it takes is about $15K including the rewiring of the underground supply, new meter base, and upgraded breaker panel as required by the local electric company and city codes.

Hi,
I have a slightly sick Cushman CE50-TG-1 and was wondering if anyone has taken any voltage readings from a working unit they would be willing to share.
I need to check the voltages at test points 3 & 4 on the 29000 board with the frequency set between 9.9999mhz and 100khz. That should give me the normal range for both the A & B VCO's control voltage's. (referenced to chassis ground) Any other voltages would be helpful so I

can note them for future reference.
Sure would have been nice if Cushman would have provided some basic voltage readings on the schematics.

Any help would be appreciated,
Thanks,
RoD

445. RF induction in car radio

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-02 01:57:42 UTC
From: "ulan@certainty.net" <ulan@certainty.net>
Message-ID: <1138845462.400692.139790@z14g2000cwz.googlegroups.com>
Source record: 11281

I installed a VFH/UHF radio in a 1997 Grand Cherokee. The RF antenna is approximately two feet horizontally, and slightly higher from the Jeep's radio receive antenna. If I was listening to the vehicle radio and keyed the VHF radio, it would mute the vehicle radio. The vehicle radio finally is no longer working, except for one station. I am assuming an induction problem. Technically, what exactly happened, how, or not to fix the vehicle radio. How to prevent this problem in the future. I raise this question not so much for the sake of the Jeep, but because I am proposing to a put a VHF/UHF rig in the lady's 2005 Honda Accord. The only viable place on the car is a trunk mount. It appears the car radion antenna is embedded in the rear glass and I believe this area is also where the XM radio antenna is located. I have tried to contact Honda on various levels but have had no success. I am wondering if I put the VHF radio in the car, will it "burn out" the other radios. This should give something for a lot of conversation. I hope I can get some help.

Thanks,
Ethan Davis KB3EGG

446. New program - Antenna Counterpoise

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-02 02:11:07 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <drrpnr$64h$1@nwrdmz03.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 11282

A coil-loaded counterpoise at a low height above ground is used to provide an artificial ground for an antenna when, for some reason, a true ground connection is not possible or there is not enough space to erect a full 1/4-wavelength horizontal wire.

The principal effects of low height are a loss resistance induced in the wire from the ground, and a reduction in propagation velocity along the wire.

A counterpoise can be considered to be an artificial ground. Its input resistance at resonance is equivalent to the input resistance of a true ground connection but its resistance will never be as low as a good ground.

To provide a lower input resistance three or four counterpoises can be used in parallel. Or they can be resonant on different bands.

New program C_POISE estimates the performance of a single coil-loaded counterpoise. The number of turns on a coil of given length and diameter needed to resonate a low wire to 1/4-wave resonance is calculated. The input resistance at resonance is also estimated..

All program output data is approximate due to the very low height of the wire above ground and uncertainty in the characteristics of the soil or whatever other materials may be under the wire. The wire may be allowed to rest on the ground surface but uncertainty will be at a maximum. It will nearly always be needed to prune the wire length for resonance. Or when the wire length is fixed the coil turns may need adjustment.

When wire height exceeds wire length accuracy is much improved. Input resistance at resonance will be fairly small. Working Q will be high and the counterpoise will behave as a short antenna. For precise resonance the wire will still need pruning.

Download program C_POISE in a few seconds from website below and run immediately.

In our 1996 Chevvy Cavalier have a 50W VHF / 35W UHF rig into a
dual-band mag-mount on the roof and the vehicle radio antenna is on
the rear fender, about 3 feet away. I have never had the type of
front-end overload that you describe.

>The vehicle
>radio finally is no longer working, except for one station. I am
>assuming an induction problem.

Not an "induction problem". Maybe perhaps the rf did damage to the
auto radio's front end, reducing the sensitivuty of the radio, or
did some damage to the digital circuitry used to tumne and control
the radio. You did not specify if the problem was with the AM or FM
bands.

Of course, that's the high-tech discussion. Perhaps the problem is
a bad antenna-to-auto radio connection. I had that happen once in a
1976 Plymouth where the radio's antenna socket was not soldered to
the radio chassis.....

>Technically, what exactly happened, how, or not to fix the vehicle radio.

It may be cheaper to have a good quality after-market vehicle radio
installed rather than pull the old radio, have it repaired, and
reinstall it. If we decide to keep the Chevvy much longer, we need
to do that to replace the jammed cassette tape portion of the radio.
We'll take it to Circuit City or an equivalent radio shop - the days
of standing on my head to repair car radios or install 2-way rigs
are long passed, and I wouldn't have a clue how to disassemble the
Chevvy to take it out. I'll leave that to others - it's worth the
price.

>How to prevent this problem in the future.

We had this happen when a 100W VHF radio took out the front end of a
very expensive spectrum analyzer which was connected to an antenna
on a mast 10 feet away from the comm antenna. The solution was not
to key the comm radio unless we were sure that the analyzer was
disconnected from the antenna lead.

There should be some front-end protection in a high-end auto radio.
Check it out before you buy.

>I raise this question not so much for the sake of the

>the other radios. This should give something for a lot of
>conversation. I hope I can get some help.

Why can't you put the antenna on the roof "as God intended it" ??
I prefer the mag-mount because with a flick of the wrist I can take
it off to go through the car wash or leave the car in the shopping
center parking lot for an extended time and not have it be a break-in
target.

BTW - I understand that Honda cannot be bothered to answer such
questions from buyers of their products. Don't take it personally.
Perhaps your dealer can help you better than "Honda".

No tears shed over that loss, eh? I've used a club MV Field a number of times, and it just didn't impress me. doing simple things required diving into the manual, heaven help a person if they lose the manual. My pet peeve was the brightness of the display. It wasn't bright enough, so I looked in the manual, and after 5 minutes found the menu item to change the level. Go to it, and find out it is already at the brightest setting. Really, if they want to design an inadequate display, why offer the option of making it even dimmer.

But that is just one of many issues. Using that variable speed tuning doodad in back of the dial was either too slow, or waaaaayyyy too fast. Did I mention way too many menu items?

The auto tuner seemed to have less range than other radios. It wouldn't tune an 80 meter dipole across the band while an old IC-765 (now that's a radio) would easily tune it. Tuning seemed a bit slow in all cases.

Did have a good notch filter, though. Audio filters were okay. I found myself using only one or two though.

But all in all, it just wasn't much fun to operate. Perhaps all parts of the reason it has been discontinued

> I looked at the Kenwood TS-2000, but it is just too ugly. Multiple

Hard to say. The bad reports weren't too frequent. But you are right -
the radio IS ugly....

Read the owner's manual. It will advise what precautions, if any, need
to be taken with regard to two-way radios.

As far as the dealer goes, they offered to look into it but had no better luck than I did. What is frustrating is that when they are approached with such a question, it is as if I have just come from the darkest regions of Africa, with some strange object or ritual they have never heard of, or seen.

Thanks for the reply

No luck with the owners manual. Technically, the radio should be protected by the manufacturer, but like other large businesses it is part of that business to protect itself against liability by not offering concrete guarantees, or suggestions on the proper method of protecting the car's radio.

I own a 1995 Ford Explorer and have it equipped with a 50/144/440 radio that runs from 3-50 watts. I have my VHF/UHF antenna permanantly mounted on the roof (Larsen low profile 18" dual band). I run the radio into a diplexer and have a separate antenna for 6 meters. The way I have it rigged up is the 6 meter antenna also serves as my AM/FM antenna through the use of a splitter. I also have a 100 watt HF radio with a multiband antenna on the rear bumper.

I have noticed interaction with my AM/FM radio at the 3 watt level on UHF. High power almost always takes out the broadcast station but the receiver has never been damaged.

When I transmit on HF, I can hear the SSB signal over the car stereo speakers.

You don't mention how much power you are running but if your transmit antenna is only 2 ft from the AM/FM antenna and you are running 40-50 watts, I would not be comfortable with that distance.

As for fixing the existing radio, you would probably be cheaper to get some aftermarket system. Just be aware, when you do, if you are using existing OEM speakers, often times, there may be an impedence mismatch with the OEM speakers and an aftermarket receiver. Most aftermarket units are 8 ohms. I have seen OEM speakers that were other impedence.

FS: Icom 706 MK II
HF transciever plus 6 Meter and Two Meters
Has mobile bracket/ Mic/short power cord with fuse.

Has all the optional modules it would take (has the ones that now come standard) I really like the little DSP notch filter best. It has a nice narrow 500Hz CW filter also. Was mobile, has minor scratches, but by no means, looks beat up.

The microphone took some modifications a couple years ago when it was used with a pair of units in PSK31 applications so you might have to replace the element.
If you close talk the microphone its fine, otherwise replace mic element.
Does full power!!!

Looks and works fine!!
Price: 435.00 Shipped Firm.

461. Analog S/RF meter vs. Digital S/RF Meter - Cast your vote here! (Heads up Kenwood, Yaesu, Icom and Ten Tec!)

I know at least one higher up at a major Ham radio manufacturer reads these news groups, so maybe this will make it in to the right hands.

How many of you prefer a real analog d'Arsonval movement S/RF meter to a digital bar graph S/RF meter?

My vote goes for a great big detailed analog meter with a real needle any day. Give me a radio with a great big Kenwood TS-940s S/RF style analog meter, and forget about the LCD/LED S/RF meter. Even the LCD attempt to look like a real analog meter just does not cut it for me. If a moth can't land on the needle and go for a ride it's not worth watching.

:)

Available on eBay (item #5862005427) is a complete set of four Motorola MX350S Synthesized, DES Encrypted VHF radios. These former White House Communications Agency radios comes with a six position charger/conditioner, batteries, manuals, RF test cable AND a DES Keyloader. Because this system uses DES Encryption, it can only be shipped to a U.S. address.

I agree, on both counts. The developer of it did a demo at a local ham-club meeting a few months ago. The commonest reaction among the audience members seemed to be drooling (over the features and capabilities) and winces of pain (at the cost).

Its price seems to be in the same ballpark as the couple of HF-band vector network analyzers that have become available in the past few years (the N2PK and TAPR/Ten-Tec versions) and unlike those VNAs the Timewave is self-contained and does not require a PC for control and display.

On the down side, none of these VNAs is able to operate on the 2-meter or higher frequencies (although I understand that the N2PK has some VHF narrow-band extension add-ons). Since the Timewave is roughly twice the cost of the MFJ antenna analyzers, and won't operate above the 6-meter band, its appeal to most amateurs is probably somewhat limited.

It's a nice piece of kit. I'd enjoy having one myself, but wouldn't use it enough to justify the cost.

It might be the sort of thing which would end up as club gear, for a club of well-heeled HF/DX enthusiasts.

Hi,
I have a slightly sick Cushman CE50-TG-1 service monitor and was
wondering if anyone has taken any voltage readings from a working unit
they would be willing to share.
I need to check the voltages at test points 3 & 4 on the 29000 board
with the frequency set between 9.9999mhz and 100khz. That should give
me the normal range for both the A & B VCO's control voltage's.
(referenced to chassis ground) Any other voltages would be helpful so I
can note them for future reference.
Sure would have been nice if Cushman would have provided some basic
voltage readings on the schematics.

Any help would be appreciated,
Thanks,
RoD

I did, they arrived, I hooked them up and after a couple of hours they
were just like my other 15-year old Minimus-7's - the foam surround
crumbled and fell off the driver.

Well, now I have 6 Minimus-7's, 5 with basically zero foam surround
left and one that's just on the verge of falling into pieces.

I gotta learn how to fix these foam surrounds! Either that or buy some
brand new drivers.

Tim.

474. "Ultra" portable MW-SW-FM receiver recommendations?

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-04 02:57:56 UTC
From: Roger <roger@doesnotexist.com>
Message-ID: <kt58u155ah7p1s0gcriba2e94hnksg2nff@4ax.com>
Source record: 11310
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.shortwave

I currently own a Radio Shack DX-399 (same model as the Sangean ATS-606), which is a quite solid, portable LW-MW-SW-FM receiver with quite good sound quality when delivered to ear buds (FM stereo to earbuds.)

I mostly use this radio for local MW and FM listening, but will occasionally listen to SW broadcasts, and DX-MW using a Radio Shack loop.

I love this radio for its portability, but am looking for another to put one of them away in a Faraday box for use in case of a major emergency.

So, what other makes/models should I consider? Repeating some of the above, here's my criteria:

1) The size of the DX-399 or smaller.

2) General coverage MW-SW (up to 30 kHz), and with stereo FM (when fed to earbuds). Don't need LW.

3) Good sound quality (especially of FM) when fed to earbuds.

4) As good or better sensitivity than the DX-399 for MW dxing and SW.

5) Don't need SSB, but would be nice.

6) Don't care too much about speaker quality, since I would use it exclusively with earbuds.

7) Don't care about the other bells and whistles (e.g. alarm), but some station memory would be nice.

So what are my other options? New and/or used (buyable through eBay) will be considered.

Thanks!

Roger

Buy a second DX-399 if you can find one. Either that or a Sangean ATS-606. It's clear that you like the radio a great deal, so why mess with a good thing?

I own a DX-399. I bought it when Radio Shack lost its mind and dumped the Radio Shack brand SWRs. I think it is a terrific little radio. Its oddest likable attribute has to be the multiple voltage wall wart. With the included adapter, you can use it in Europe on 220 Vac.

Look in your phone book for "speaker repair." The foam disintegrating
happens a lot in dry climates, and if the voice coils aren't too
abraded, they can be replaced by a speaker repair tech.

The voice coils get abraded by using the speaker as the foam is
disintegrating, and they wear against the surrounding magnet and
frame.

Seems like the Grundig/Eton YB-400 would fit the bill for you as well.
Might be slightly bigger than your Radio Shack model, but has the
features you mentioned, and then some.

Don't know what size your Radio Shack DZ 399 is but I have had the Sangean
909 for years and it works great and it is a good travel radio or
emergency one too. It may have more bells and stuff than you what but in an
emergency they may be handy to have as well!

Tell us more about your emergency scenario?
Although it's possible to come up with a situation where there's an EMP
that doesn't get thru your faraday box and doesn't kill you, either
directly or indirectly...
I think you're much more likely to succumb to a dirty bomb or car bomb
or bird flu or be hit by a bus or killed by a jealous spouse or your HMO.
What are the other parts of your survival strategy? Radio doesn't
do much good if you don't have food/water/shelter.

Hmmm, wonder if the radio transmitters are in Faraday Boxes?

494. Newbie equipment recommendations?

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-05 00:59:36 UTC
From: Richard Crowley <rcrowley@xpr7t.net>
Message-ID: <11uajfpa22hphf6@corp.supernews.com>
Source record: 11329

I just passed my Element 2 test this afternoon (and missed
Element 3 by only 3 questions even though I haven't yet
looked at the General class question pool :-)

So I will be looking for some VHF/UHF equipment (HT
& mobile?) in the next few weeks. I had looked around
some websites several months ago and concluded that
there was a particular brand/model of HT that seemed to
be both widely-used and highly-regarded. But now I
can't remember the recommendation (or the websites).
So IS there a "sure-thing" or "everybody's favorite" HT
or mobile rig out there? I'm not averse to 2nd-hand if
there is some way to confirm proper/legal operation.

I have some years of experience in audio,video and
general electronics, and I know when newbies (like
me) come to one of those newsgroups with this kind
of question, everyone rolls their eyes and makes
snide remarks about such a public display of ignorance
So I know I risk looking silly coming and asking this.
But hey, they say there are no stupid questions except
the ones you didn't ask. :-)

If it makes any difference I am in the Portland, OR
metro area. Assuming I will find out sooner or later
what the local scene is like.

I like my Icom IC-706MkIIG (HF/6/2/70cm), which I occasionally use mobile (with a set of Hamstick antennas) but mostly use at home with a long wire and the AH-4 autotuner.

When I was living in an area with many 220MHz repeaters, I bought a Kenwood TH-F6A HT, but now that I'm in an area without much 220MHz activity I might pick a different one -- perhaps the Yaesu VX-7R (which has 6M and does cover 220 as well but only with a minuscule power output). Check a repeater directory to see what frequencies are in use in your area.

I second Perce's recommendation on checking the repeater directory;
it's a safe bet that most areas have 2 meter coverage, the landscape
changes though when you look at 220 and 440. For instance, in the Los
Angeles most 440 repeaters are private (closed) systems - 220 does not
have as many repeaters but a higher percentage of them are open.
Check to see if there is a local ham club - that would be a source of
info for what bands are most active.

As to which equipment, I did use a Yaesu FT-50 and it served me well,
however it saw some extremely hard usage (in inclimate weather,
several drops, banged around in a briefcase etc) and sometimes gets a
bit flaky even after a couple trips to Yaesu service. Don't get me
wrong - I have no problems with Yaesu, just gave this handheld a
little too much rough treatment. Opted for the Kenwood TH-F6 as a
replacement due to it including 220 which I use sometimes so now I
only need one HT instead of two. Try to keep in mind that choosing
equipment is like choosing a car in that some folks like Ford and
others Chevy and you'll find the same with ham equipment. Generally
if you buy from Kenwood/Yaesu/Icom you'll get a decent product; it
comes down to which features (and band combinations) you want/need,
which one feels best in your hand and which one seems more intuitive
to operate (program). You can often find the manuals online and
checking them out might help. For mobile equipment look for
something that has a removable control head if your vehicle is cramped
for space. Dual band radios come in two basic varieties : 1) both
bands on at once and 2) one band at a time. As you might guess,
option 1 tends to cost a bit more.

So, I didn't directly answer your question but I hope I gave you some
information that helps you make a good decision. Congrats on the
license & welcome to the amateur community!

Howard

I was wondering why he needs to put the radio in a faraday cage myself.
I've read that a typical EMP pulse bomb like Al Qaeda would most likely
use would mostly work on anything *that was on the same frequency*. That
means that if you're not in the immediate area, and your radio antenna
isn't harmonic with the wavelength of the pulse, you have nothing to
worry about. Dark Angel type scenarios where the whole country is wiped
out by an EMP pulse apparently aren't very realistic, but they make for
good TV. I think a dirty bomb is more likely. But the real threat is
bioweapons-if Iran could weaponize bird flu or smallpox and make it into
a super killer then the shit would hit the fan. Smallpox has the
potential to kill 9 out of 10 people, that's what it did to the Indians.
I'm more worried about a flood since I live in a part of California that
has frequent major floods. I just worry that I wouldn't have the
presence of mind to take my Degen, since I'd have 15 minutes to
evacuate. A lot of the New Orleans refugees didn't have radios, and the
lack of info caused by that and govt bungling caused much of the panic.

Don't mount the ham antenna and the broadcast antennas within 2 feet
of each other. 4 or 5 feet would probably make the difference. They
are about 6 feet apart on my 4-Runner and I notice no interaction even
when running up to 160 watts on 2-meters.

>It appears the car radion antenna is embedded in the rear glass and I
>believe this area is also where the XM radio antenna is located. I

I doubt it'd bother the XM satellite antenna as that is so far removed
in frequency from the ham frequency, BUT it depends on how well
grounded that system is. If the feed line is not grounded right at
the window it could also pick up signal from the ham antennas.

>have tried to contact Honda on various levels but have had no success.
>I am wondering if I put the VHF radio in the car, will it "burn out"
>the other radios. This should give something for a lot of
>conversation. I hope I can get some help.

Any time you mix radio systems there is *some* risk. It may be
miniscule, and it may not. You should see what we have to go through
to get an IFR certified GPS system installed in an airplane. It has
to be tested "in flight" against all of the other radios in the plane
before it can be certified.

Then again, some where, some one will find a way to do it. I prefer
to let some one else find the best way. It's both easier and cheaper

that way. <:-))

500. Yaesu FT-857 CAT commands

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-05 09:33:59 UTC
From: SMØIMJ <sm0imj@telia.com>
Message-ID: <bEjFf.155307$dP1.513515@newsc.telia.net>
Source record: 11336

Hi all,
In the manual for the FT-857 there are a number of CAT commands listed.
I know that the FT-857 support a huge number of commands "not" listed in
the manual. If you have tried the Ham Radio Deluxe rig control/log
program you probably noticed that every menu item in the FT-857 can be
changed using the CAT interface.

Has anyone came across any listing of these not documented CAT commands?

First one that will set up a serial line sniffer and list everything
going in and out from Ham Radio Deluxe to the FT-857 to back-track the
CAT commands, I will by a beer. I have a free software serial port
sniffer if anyone feels like giving the CAT interface a challenge?

Al Qaeda has no bombs. They don't need them. The destroyed the USA
with $20 worth of box cutters (and the help of an incredibly
incompetent [or worse] administration).

Richard,

I also am a Newbee to Ham but I got a Kenwood TH-F6A HT and love it. I'm in the L.A. area so I find 220 more open than 440 but I figure where ever I go I'll all three bands covered with this little HT. I too am looking into an mobile for the truck and/or the home. The Yaeshu FT-8900 dual band or the 8900 quad band looked nice to me. Good luck.

"Ultra" portable inherently means a very small ferrite bar antenna for LW-MW reception. Which will preclude any strong stand alone performance on LW-MW without an external LW-MW antenna like the Terk Advantage AM loop or something else for LW.

My picks for the ultimate "Ultra" portable are the Sony ICF-SW100 or ICF-SW07. Both have Synch Detectors.

I thank everyone for replying to my inquiry about the best small portable MW-SW-FM radio meeting my list of specs.

With regards to the various "Faraday Cage" comments, I'll not reply to them in any substantive way since that is off-topic here (want to focus on "radios"), but for those interested, just do a Google search on "EMP Faraday," and several informative articles will result.

Now, as I look things over, I'm getting more and more intrigued with purchasing a Degen/Kaito 1103 portable.

So, where can I find this model at the lowest price? Also, should I stick with a Kaito (for the American market), or can I consider a Degen? (I heard the walwart with the Degen is not for U.S. voltages.)

Thoughts? Recommendations?

Thanks!

Roger

laugh

Well, David recommended I look at the Sangean PT-80 ProTravel, so I assume his comment about me needing psychotherapy is because I did not take his recommendation.

David (and others), how does the PT-80 compare to the Degen/Kaito 1103 with respect to MW and SW reception performance?

I save quite a chunk of change going with the 1103, plus the 1103 is a little smaller and lighter. Also, my research indicates the 1103's performance in several important categories appears to be better than the PT-80. To me, it seems like a no-brainer.

Comments?

Thanks.

Roger

Er, ok.

Anyway, I'm considering using the Degen as my daily listener, and relegating the DX-399 to storage. So I am interested in the here and now ("pre-Cheney bomb".)

So, let's get back on track and compare. Let's compare the relative sensitivity (MW-SW), and audio quality using earbuds between the following "ultra" portable models:

Sangean PT-80
Sangean ATS-606 (essentially same as Radio Shack DX-399)
Degen/Kaito 1103
Sony ICF-SW7600GR
Sony ICF-SW100

(Of course, there's a great variation in price, and in features. The ATS-606/DX-399 does not have SSB, which to me is not important, but to others is important. When I bought my DX-399, I paid ~$35, so it was a no-brainer to get -- I should have bought two.)

I'm sure a couple others could be added to the above list, but they should not be any larger than the largest already there.

Roger

The Sangean 909 is aka the Radio Shack DX-398, which I also acquired at the same time that I acquired the DX-399. The DX-399 is about the half the size. It is really a terrific choice for a backpacking tour of Europe, Australia, Asia, etc. What a gem.

I'm not a big fan of Sony. They break.

I have an ATS-606A (it has 1 KHz fine tuning). I enjoy it. The PT-80
intrigues me.

Will everything everywhere be wiped out by the bomb? Will all
transmitters be wiped out? I figure that Europe will be spared, and thus

I can listen to the BBC. EMP covers a narrowly defined area. You can't get it to cover whole continents unless you send it REALLY high up in the atmosphere. The only rogue state with ICBMs is North Korea, and if Kim would launch anything, he'd launch an actual bomb instead of an EMP device. Of course, the USA could send up an EMP device over Iraq, but they already have ways to counter cell phone triggered IEDs (now the insurgents run wires).

Isn't "Miss Nude Islam" an oxymoron? In fact, isn't the beauty pageant considered to be against Islam? In fact, we'd probably have Dialing For Jihad, an imam will say a prayer to help your car bombing be successful, and will read appropriate verses from the Quran. All for 499 riyals. We'd have game shows like Tribal Feud, people try to guess what Muhammad actually said (And the Prophet Says...) with the winners killing the losers. We'd have Jerry Springer like shows: My Wife Shows Her Ankles In Public! The host would give the husband a scimitar to behead his whorish wife with, then the audience would attack each other. Ah, the brave new world of the universal Islamic caliphate!

Well, you won't find as good of a deal as Radio Shack had. The PT-80 is cheap and is a better clock than a radio, according to Passport. If you like the 606, get another one, but you won't get it for anywhere near $35. If you want a Degen (either the 1103 or the sister rx the 1102) then you can find new ones for $50 on Ebay. If you want a Sony, you'll pay through the nose ($150 for the 7600-IF you can find one). When there are better, cheaper portables out there, why bother? Bottom line: if you want an identical twin to what you've got, buy the Sangean. If price is a concern, buy the Degen. Oh, and ignore David, he's a weirdo.

Well, price is a consideration, but so is performance.

When it comes to receiver performance (sensitivity/selectivity/etc.)
how does the Degen/Kaito 1103 compare with the Sangean ATS-606?

From what I've read, the 1103 is a better performer in this regard. It
is supposedly at least as good in audio quality (to earbuds.) And
throw in SSB to boot.

The one downside to the 1103 compared to the 606 is that it is
slightly larger in size and weight (but not much.)

Anyone here done a side-by-side comparison between the 1103 and 606 (or the equivalent RS DX-399) with respect to MW-SW reception?

And where can I get a Degen 1103 for $50? I checked on eBay, but haven't found a seller yet at this price. The best price I've found for any 1103 is $89 (and a Kaito which is for the American market.)

Anyone?

Roger

Try an ebay seller named Liypn, his store is V Com Collections. His radios are labeled Degen and are for the Chinese market (but mostly labeled in English) and run around $45 or so. He doesn't use the name Degen at all in his posts, just the model "1103". Search for "1103" or some other radios he carries like "Tecsun" (called Grundig or Eton in the US) and some ads from him should pop up. Whenever I need to find his site I search for "Tecsun" and then look in the results for V Com Collections (be careful not to click the wrong store-two or three show up). I don't have either radio, so I can't give you a side by side test. Ask someone who has 100 radios (there are several here) for an opinion.

http://stores.ebay.com/RADIO-AND-COMPONENT

http://stores.ebay.com/V-COM-COLLECTIONS

The 1103 beats all other SW portables price to performance wise.

Yes. The 1103 wins in sensitivity and sound over the 606. MW reception on
the 1103 is excellent too.

> And where can I get a Degen 1103 for $50? I checked on eBay, but

Look for Liypn on eBay. His eBay store is called V-COMM COLLECTIONS.

Jackie

It's absurd to think that you'll have time to relax by the fire while
your generator humms along keeping your minute steaks frozen after
such an event.

This threat of war is fake. The pigs want to scare you into
submission. Bin Laden works for Bush (or vice versa).

On Ebay you will get the best price for a Degen DE 1103. The Kaito
badged DE 1103 can be had in the U.S. for about $30.00 more.

Rather than trying to use the built-in wall wart charger I opted to
rotate two sets of NIMH batteries and a separate charger. The
built-in set-up for charging was not well designed because you have to
set the number of hours for charging - no auto sensing circuit on
either model. Leaving a portable hooked up for 12 hours seemed to
defeat it's purpose as a portable.

528. FT-857D Remote Mounting

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-06 19:42:35 UTC
From: KG7HQ <moravian_knight@yahoo.com>
Message-ID: <1139254955.897639.267860@g47g2000cwa.googlegroups.com>
Source record: 11214

Hello All,
I recently purchased a FT-857D to replace my ailing FT-100D. It seems to be a great little transciever for the price. I had also purchased the remote mounting kit for my vehicle installation.
I was a bit disappointed to see that you don't really get a "Full" mounting kit for the price. Like the FT-100/D, you need to purchase the Yaesu MMB-62 in addition to make it usable in multiple mounting enviroments. What's even better is that there isn't any reference of needing this mounting platform anywhere!
Looks like Yaesu over looked this one so beware. The mounts seemed to be still available from many of the radio vendors.
73's
Michael

I have forwarded your message to Riley, you may now explain to him why a
holder of an amateur radio license would be in violation of FCC regulations.

532. FS Icom IC-736 HF/6m Base

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-07 17:49:14 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <C45Gf.2202$Nq1.1564@dukeread11>
Source record: 11218

FS Nice ICOM IC-736 - HF/6m Base Transceiver. HF base transceiver RX: 500 kHz-29.995 MHz, 50 MHz-54 MHz TX: all amateur HF bands + 6 meters Output power: 100 W (40 W AM) Modes: CW, SSB, AM, FM. Includes orginal icom hand mic, built in tuner, built in AC power supply, and power cord. This transceiver has a Power Supply problem. For awhile it would take a few minutes to come on after applying power. When it does come on it works fine. Gradually, it has taken longer for it to warm up and come on until now it does not come on. It has got to be something simple in the PS but I am no technician. Cosmetics are very good. I can send pictures. These rigs are selling for over $600 in working order. My Price is $400. Thanks, Charlie Hugg, K5MBX

533. FS Nice Icom IC-275H All Mode

Newsgroup: rec.radio.amateur.equipment

Hello to All of YOU!
I'm looking for an advice on two questions:

1. What radio should I buy between the two: Yaesu VX-7R or Kenwood TH-F6A
2. Where should I buy it from (price) or maybe someone sells one used ?

RE: the first question: I want this radio in order to be able to monitor (listen) to all possible things: weather, radio, police chat, trackers, taxi dispatchers an so on.
Also I would like to be able to talk back to some of them (definitely not a police :))
If it's matter, I'm in San Francisco, CA and love to hike in Lake Tahoe area of the Sierra Mountains.

Most frequencies REQUIRE some sort of license to "talk back".
It's unlikely that either radio can be used legally transmit outside the
ham bands.
Get a trunk-tracking scanner. Use your cellphone for talking.
mike

>I'm looking for an advice on two questions:
>
>1. What radio should I buy between the two: Yaesu VX-7R or Kenwood
>TH-F6A

They're both popular radios with lots of features.

The VX-7R has 6-meter capability (which few people seem to use -
there's not much 6-meter FM traffic in Northern California) and its
220 transmission power is fairly low. It's water-gasketed and can
survive splashing and some immersion - but I've heard some people
complain that the microphone's waterproofing membrane muffles the mic
and makes the transmitted audio quality poorer than previous Yaesu
radios.

The TH-F6A doesn't have 6 meters, and isn't waterproofed as far as I
know, but has full-power 220 transmit capability.

These radios are likely to be fairly competitive in terms of their
basic output power, sensitivity, and capabilities. Which you would
prefer may be as much a matter of personal taste and operating style
than anything else. I'd encourage you to try 'em out - at least for
reception - before making a decision.

For all HTs of this level, programming the memories (potentially,
hundreds of them!) becomes a significant challenge. Both of these
radios can be programmed using a personal computer (running Windows or
an emulator thereof), using suitable software and a special
PC-to-radio cable.

Officially-supported software is available for the VX-7, but it's a
commercial aftermarket product which is not cheap. There's also some
reverse-engineered freeware (VX-7 Commander) to do the same thing.

Kenwood makes programming software for their radios available for
free... it can be downloaded from www.kenwood.net

You'll need a suitable cable/adapter, to convert the RS-232 signals
from your PC's serial port to the 5-volt open-collector signalling
which these radios use for programming. You can buy adapters from RT
Systems (they're sold with their Yaesu programming software) or from
Kenwood. It's often possible to use one vendor's adapter with another
vendor's radio, if you build the right sort of cable to go between 'em.

>2. Where should I buy it from (price) or maybe someone sells one used ?

The prices for new radios of this sort don't seem to vary much from one dealer to the next. I've heard that the dealer profit margins on such radios are very slim... there's not a lot of room for dealers to cut their prices.

You _might_ save a few dollars by buying by mail from an out-of-state dealer. However, the savings are likely to be small if the deal is honest. Since you've got a good well-stocked dealer in your area (Ham Radio Outlet over in Oakland) you could do lots worse than to just hop BART over to the East Bay and buy one locally. That way, you'll have the advantage of local-dealer support if anything turns out to be wrong with your radio, and might avoid having to send it back to the manufacturer for repair or exchange.

[The first VX-5 I bought, from HRO's Sunnyvale outlet, had a microphone which went bad after a few weeks. They swapped out the radio for a new one even though it was past the normal 7-day over-the-counter exchange.]

>RE: the first question: I want this radio in order to be able to
>monitor (listen) to all possible things: weather, radio, police chat,
>trackers, taxi dispatchers an so on.

All well and good. Both of these radios should be able to receive any AM or narrow-band FM signal in those bands. Neither will be able to handle the newer trunked-digital UHF systems.

>Also I would like to be able to talk back to some of them (definitely
>not a police :))

Not a good idea. Not legal. These radios are not certificated for transmission outside of the ham bands. Using them in that way can get you into quite a bit of trouble, for transmitting without a proper license and for transmitting using noncertificated equipment. Loss of amateur-radio license, big fines, etc. can result (and do so result from time to time).

>If it's matter, I'm in San Francisco, CA and love to hike in Lake Tahoe
>area of the Sierra Mountains.

I'd recommend that you buy a better antenna for whatever radio you get. The "rubber duck" antennas sold with such HTs are fine for most in-city uses (especially when using a local repeater) but they're not a great choice when you're out in the woods, far from your nearest repeater, and *need* to get a signal through. A "spaghetti-noodle" quarter-wave whip, plus a 19" counterpoise wire, will add a lot to the 2-meter range of a radio of this sort.

Without making a judgement call on your questionable comment regarding
talking back on possible non-ham frequencies, I'll make two comments on
those two radios. I have owned both in the past.

I preferred the Kenwood for two primary reasons:

The Kenwood was capable of receiving SSB in the HF frequency range,
albeit the sensitivy was EXTREMELY POOR in that regard.

I highly prefer the Kenwood Menu system.... it was much more intuitive
to use compared to the Yaesu radios.

Both are well built solid transceivers, though.

While you may be able to receive most/all of those
sources (because both models have a wide-band
receive function) , it is very unlikely that any of those
services are using ham bands, which would preclude
you from "talking back" to any of them. Also neither
radio will transmit in the bands they are likely to use.
Fortunate for you since is is almost certainly very illegal.

A "scanner" type receiver seems more suitable for
listening to the various services you mention. Particulary
in a large city where they use "trunking" and other
systems for sharing (and jumping around) between
different frequencies. Many scanners are progrmmable
to handle this. But neither of the radios you mentioned
can follow these kinds of conversations.

I was just looking at those very two models after getting
my callsign (KE7GKP) just yesterday.

I just bought the Yaesu this afternoon and am still reading
the book. The Yaesu was recommended very much in
preference to the Kenwood by the guy at HRO in Portland.
He claimed the opposite, that the menu system of the Yaesu
was simple enough that he needed the book only once every
vew months, but the Kenwood he never could manage.
Go figure? :-)

It would be hard for me to figure out why an HRO sales person couldn't
program a Kenwood. It's too much trouble on any radio without a
computer when you have hundreds of frequencies to input, along with
various option settings. With the free Kenwood software and a cable
it is a simple chore. I would much rather operate my computer than
the tiny buttons on an HT for programming. BTW, the TH-F6A is the
finest HT I have ever owned, and I have owned a LOT of them. I also
own the TH-D7A, but it is the F6A that goes with me on public service
events, etc. I love that little radio.

I spent nearly 2 hours at the HRO in Oakland trying out both - After some serious thinking I ended up with the Kenwood.
At that time it was because I felt it wiser for me to opt for 220 over 6M in a HT. After well over a year of using the Kenwood, I have to say that it is by far the best HT I have ever had.

Drawbacks?
No drop in charger.
Speaker Mic and pwr jacks are on the side instead of the top.

I often wonder why anyone would want 6M in such a small qrp format unless they lived within eyesight of a 6M repeater.

Jim..

You could probably get away with bolting a Kenwood TS-440S/AT under the dash on the passenger side! ;-)

No really - look at the catalog for the compact mobiles with the remote heads. You could probably fabricate some sort of mount that slips into those vents above the stereo.

Personally? I drive a Mustang and use a TH-F6 Triband HT that fits in my shirt pocket.

>Tim Mize N7XAU
>tmize57@juno.com

Tim,

The cloning cable has a RS-232 to TTL level converter, hope you built
one with the converter. The F3 / F3S will not connect directly to a
computer RS-232 port.

The cloning programs are the same. The F3S is a simpler radio, without
the DTMF keypad.

I don't have the F3 information at hand but you do need to place the
F# into cloning mode, usually by holding down a button while powering
up the radio.

When using the program you need to first READ the radio contents into
the program. Icom's have hidden data in the radio that you can't input
yourself.

Starting the cloning program and trying to reprogram the radio without
first reading the contents of the radio will cause cloning to
fail. The hidden data gets over written with empty numbers.

To fix that see if someone can send you an Icom .icf file for an
F3 / F3S. They are the same if the frequency coverage is the same.
Load up that .icf and clone the radio, now read the radio back into
the program and make your frequency changes. and clone the radio
again. Save the modified file as your .icf.

I hope some of this helps

Gary K8IZ

well it would depend greatly on what bands you wished to work mobile
the Icom 208H is a tiny 2/70cm FM rig with detachable face the radio
could fit nearly anywhere
if you wanted HF the Icom 706 would do nicely you could mount the radio
under a seat or in the truck and mount the face somewhere flat and easy
to see
as for antennas the field is wide open depending only on how deep your
pockets are

> or the 8900 quad band looked nice to me. Good luck.

The Yaesu FT-7800R is a great (and inexpensive) dual band mobile rig. It has a removable face that makes it easy to mount just about anywhere. It also has the capability of being programmed from your computer*with the appropriate software and cable). If you do any traveling, you can pre-program one of the memory banks for the repeaters in that area, along with the machines along the way with just a couple of keystrokes. BTW...it has 1000 memory slots avalable :-)
I don't know of any places across the US that don't have some kind of 2m/70cm repeater coverage.

Now on the HF side... This is going to depend on a couple of things.... are you going to be operating primarily from a land based station?? or mobile??
Each has several ways to go depending on budget and real estate.
Try something like a TS-140S or simular....nice starter rig...simple, basic and will do most anything you want it to do(can be used mobile also). A 20A power supply can be had for a reasonable price. for the antenna(s)... If you have the real estate, wire antennas will work well. With the addition of a tuner, a G5RV is a good starter antenna that will pretty much cover all the HF bands. If you don't have a lot of space, you might look at a verticle...maybe something like the Hustler 5BTV. If you are handy at all, and with the guidence of your Elmer, you can reasonably expect to get a nice, functional HF station on the air for as little as $350 - $400.
OTOH.... if you got lots of real estate, and more dollars than sense, you can easily sink more money into a station than a lot of folks make in a year. :-)

I considered both the VX-7R and the TH-F6A, but opted for the latter because of the full power output on 220 (although now in this new location 220 is not used much). My son and I now both have TH-F6As (for uniformity), along with two higher-capacity batteries from W&W Manufacturing (http://www.ww-manufacturing.com) and their drop-in charger that works with those batteries either detached or in place on the rig.

Hi Gary, yes I did build a level converter, found the schematic on the net, it was a schematic directly from Icom for the programming cable. I did try holding all the buttons while powering up, didnt notice any difference in the display if it was in the cloning mode, I will try again. Its good to know that the radio's and programs are the same. Sounds like I just need to get the radio into cloning mode and then read its contents. Thanks for your reply and insights, it helped alot!

The following manuals were rescued from the trash at my university during a move. I've given away some to interested parties, these manuals remain. I'm selling them to ensure that they get a proper home. Cost $2 each plus shipping. Check with me by email to get the shipping cost, which ranges between $7USD and $12, depending on the size of the manual.

All the manuals are in excellent condition with very few (if any) marks.

Email me if you are interested in any of the following manuals:

Tek 3B3 Vertical Amp Plugin
Tek 561B Scope Mainframe
Tek 545B Oscilloscope
Tek 7623 Storage Oscilloscope
Tek 53/54D Vertical Diff Amp Plugin
Genrad 1650A Bridge

These ones are currently listed on Ebay for $2 plus shipping.

Tek 3A74 4 Channel Vertical Amp Plugin
Tek 564B Storage Scope Mainframe
Tek 2B67 Timebase Plugin
Tek 321 Oscillosope
Tek 3A74 Vertical Plugin
Tek 3A8 Op Amp Plugin
Tek 3C66 Carrier Amplifier Plugin
Tek 434 Oscilloscope
Tek 5031 Oscilloscope
Heathkit O-11 Oscilloscope
HP 180A/AR Scope Mainframe
DuMont 224A Oscilloscope
DuMont 304A Oscilloscope

The DuMont manuals will be of interest to oscilloscope history buffs, they are from the 40's and 50's.

I have another box full of manuals, which I'll post in due course.

Thanks -
Peter

570. CB mic wiring

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-10 21:19:44 UTC
From: Ken C <cprstn54@att.net>
Message-ID: <3k0qu1tk6j08t679hr6rf06ekc3rftohil@4ax.com>
Source record: 11156

I am trying to adapt a CB "roger beep" mic for ham radio and there is some odd terminology for CB mic wiring.

The CB'ers call "PTT" "transmit (TX)"

They call "audio-out" "audio" (not too bad)

They have a separate line for "receive (RX)" which some call "receive control." What is that for? Anyone know? By testing, I know it is not for a speaker in the mic. It shows 6 ohms to ground.

Ken KC2JDY

Tie 1/2 of the wires together, then tie the other half together, then plug
into a wall socket.
That will take care of the problem.

BTW... there was a ham in these parts that put that crap on his mobile ham
rig.....one morning he came out to find that his mic and rig had come into
contact with a large, high velocity, inertial impact device.

I got the impression it wasn't the computer-connected programming
issue, but remembering the "menu-structure" of all the features
when using it in the field. He said that (at least for him) the Yaesu
was easier to remember the button sequences than the Kenwood.

Hi Ken -- ignore the nasty replies

About Roger Beeps on Ham Radio
Tis highly frowned on
If you use it on a repeater -- sixteen+ Hams will come back and say you have a roger beep tone
You say yeah I know
They say -- get rid of it - it sounds like CB
No FCC rules against it - but it's considered poor practice
Repeaters have a courtesy tone (beep) so your beep is not necessary

On HF - also frowned on -- if noisy conditions - just say OVER

--
CL -- I doubt, therefore I might be !

I always ignore the crackpots; most have no lives and nothing to say
of value.

Well, NASA uses roger beep with its astronauts and ham repeaters use
them all the time, but call them courtesy tones. So I see no problem
with experimenting on SSB, especially with folks I know who have no
objection. Especially if the tone if not loud or extravagant.

Ok... you got 3 replies that all said *don't do it*, and you want to call all 3 "crackpots" and ignore what they have said. Consider the levels of experience you are dealing with. Personally I have been licensed since 1984.

If you absolutely must use a beeper, then do it on the Childrens Band.. not on the HAM bands.

From a practical standpoint, you aren't going to be doing that much
programming in the field. Mostly it will be changing power levels and
frequencies. If most repeater frequencies are programmed in by
computer, all you would ever need to do beyond power and frequency in
the field would be to change the tone freq. Shouldn't be that hard to
learn to do one thing. I have had my F6A for a couple of years and
field programming has never been an issue. If it was, I would be in
trouble. :-)

In spite of my agreement with most of the flames thrown at you about this, there are certain applications where "curtesy tone" is warranted - as few as they may be.

So that out of the way, often the RX is used to enable/mute the audio If the RX is pulled low, it enables the audio path to the audio output. If open it will mute.

Here is the latest in the garage door opener saga. Edison Co. came to my aunt's house and had her turn off the main power breaker. He then asked her to have the neighbors try their openers. They worked perfectly! The problem seems to have been related to a surge protector she used on her computer system, but I don't know if that's the final answer. Hers does work fine now. I have been trying to figure out how a surge protector not connected to the opener could affect her opener as well as the close neighbors. Must have been putting out one heck of a spurious signal.

Source record: 11173

On repeaters the beep is more than a courtesy tone
It also signals that the repeater timer has been reset.

Transmission times are accumulative, if folks don't wait for the beep.
Example: A machine has a 60 second timer and station X talks for 50 seconds,
if station Y comes in before the beep, 10 seconds later the timer will shut
down the repeater. To signal a timer dropout, some repeaters use a voice
announcement, others use a series of short beeps, such as a triple beep.
Others may use a short delay, a short beep and then dropout.

As i said before -- if you use a roger beep on a repeater, a dozen plus guys
will alert you that you have a beep tone and ask you to turn it off
--
CL -- I doubt, therefore I might be !

Very interesting find. Please post any further updates on this. I'd like to know if the problem would transfer to another home if that surge protector is moved to it.... also, might be interesting to put a high frequency scope on the AC line going in,and coming out of that protector to see what is on the 120V inputs and outputs.

I see no reason to use it in any mode with a carrier; you know when
the other guy has released PTT. As I said, I want to try it on SSB
where you need an "over" to know PTT has been released. Some hams
think you are a lid unless you say "over"; I see no reason to make
like a simple machine, unless you have the IQ of a simple machine.

I believe the FRS radios also use a roger beep. They probably outsell
ham radios 100:1.

A distinction here is that the repeater itself puts the tone on to
signify when the timer has started. The tone is not superimposed by
the person using the repeater.

There are only a couple of times when transmitted audible tones are
used. One is for a repeater autopatch. The other is to awaken Litz
decoders for emergency traffic. Beyond those two applications,
audible tones have no place in amateur radio. They need to stay in CB
land.

Source record: 11185

You would be better using the DATA port for PSK31 and similar.
However, the pin out from the FT-847 manual for the mic socket is:

1 Up
2 +5V
3 Down
4 Fast
5 Gnd
6 PTT
7 Mic Gnd
8 Mic

It does not bring out RX audio. You can use the speaker jack for
that.

I may be making too much of this, but this little HT is the greatest - EXCEPT for one thing. It has left me with a dead battery too darn many times, just when it was very undesirable. If I'm involved in doing something else, and waiting on someone to call me, and the battery chooses then to go dead - I never know I missed the call.

That's just one example. It goes dead right in the middle of my transmissions sometimes, WITHOUT WARNING. I find myself with a dead radio when I let up the transmit button, and never know how much of the transmission got sent. Then I have to dash around looking for a charged battery to put in, and hope the guy I was talking with is still there.

With the ENORMOUS number of features this radio came with, of which I only use a small percentage, surely they could have included a feature to send an audible set of beeps when it's battery is near the end.

Has anyone else had this reaction? Surely I'm not the only one with this beef. More important, has anyone out there figured out how to modify it to allow some audible beeps at low battery? Surely Yaesu can do this if they want to, all my portable telephones have such a feature, telling you when its batteries are about to fail. How about it - Yaesu?

According to p. 10 of the Owner's Manual, it i supposed to show a "low voltage icon" when it is time to recharge. For the Li-Ion battery, it shows four different icons, depending on voltage.

Accoridng to p. 68 of the manual, you can monitor the actual voltage of the battery

No dispute with either of those, BUT they are about as useful as the classical "tits on a bull", though. If I have the radio in the clip on my belt, and am busy doing other things while waiting for someone to call, it might be dead for an hour or two before I think to look at the display. Furthermore, the voltage reading is ONLY given if there is only ONE line occupied with a frequency setup. And with it being a dual band rig, which is what I bought it for, then I cannot see the voltage when using it for dual band operation. Likewise the Icon of the tiny, tiny battery emblem when set for dual band operation is almost invisible to the eye.

Bottom line - it is very poorly configured for keeping on top of the battery status. Otherwise, a very good, but much "uselessly over featured" radio.

A simple beep like those on my several portable telephones is all it needs. It has other beeps, for features I'll never use, why not for this? I suspect if enough people complain, Yaesu can issue a mod to the software to provide this very needed feature.

Actually NASA used "quindar tones" which are in-band signalling to
activate ground transmitters. Those beeps were removed by a notch
filter and never made it into the uplink.

605. Problems with FT-290R SSB modulation

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-13 08:41:46 UTC
From: PaoloC <ollollo@hotpop.com>
Message-ID: <43f0464a_1@x-privat.org>
Source record: 11191

Good morning.
I hope someone has already gotten into this.

I own a Yaesu FT-290R that lately has been reported to produce a
distorted SSB modulation.

I checked with another receiver and I can unfortunately confirm that the
modulation sounds a bit warbled, fluttered, "bubbly" but still
comprehensible (say "3 by 9" RS report).

Apparently the problem worsens when the rig is operated at lower
temperatures (32F/0C or so). In low-power mode the modulation is
slightly better but still unacceptable.

FM output is OK. Output power looks fine too, at least there's an
increment between low and high levels.

Has anyone had this problem? Any cure?

Thanks,
pc

Are you certain your P.S. is stiff enough to handle the current on voice
peaks? Sounds like it's FMing some- many times a sign of poor regulation.

I tried with a 12V/7AH Pb-gel cell, a 12V/5Acont. and a 13.8V/25Acont.
supplies. They provide slightly higher voltages (in that order), which
reduce the effect, but not that much.

Anyway, for the FT-290R - which is a QRP 2m all-mode RTX - peak
consumption is 800mA! (per technical specs)

I doubt all my regulated power sources have gone bad altogether... will
check them anyway.

Per eBay:
CB amplifiers: The FCC does not permit the use of power amplifiers with
Citizens Band radios. Therefore, eBay prohibits any listings of the
following:

* CB amplifiers
* Amplifiers specified for use on the 11 Meter band
* Amplifiers designed for use in frequencies 24 MHz to 35MHz
* Amplifiers posted within the CB category
* CB Radios that are amplified to exceed 4 Watts using the AM
Settings or 12 Watts using the SSB settings

Gidday All,
this Posting to advise I have several of these High
Power (35 Watts min) Linear Amplifiers available For Sale.
One is currently listed on eBay here...
http://cgi.ebay.com/1296-Mhz-LINEAR-Amplifier-HIGH-POWER-35-Watts-more_W0QQitemZ7588553632
QQcategoryZ25392QQssPageNameZWDVWQQrdZ1QQcmdZViewItem
.... or simply Search on "1296 Mhz"

Additional information can also be found on my Website as per below.

Questions : Email me. I will gladly provide more information.

Cheers & thank you.

Alan - VK3XPD.

Source record: 11114

I have been playing around with receiving AIS (Automatic Identification System) signals. AIS is used on ships, it is used to send information about your position, etc via VHF to the surrounding ships. But know this started to get a bit boring. So know I wan to try to se if it is possibly to receive the VMS signals from Inmarsat-C. The VMS system is manly used on fishing vessels. On the ship there is a box with a gps and satellite tranciver. The position information is send each hour, to a land earth station, were it is distributed to the different authorities.

The first thing is to receive the signals. But also to decrypt the data can be complicated.

Any help or advices are welcome. Also if you have some good links to people ho have been dealing with projects like this, could be useful.

Cheers Michael

Hi,
I am looking at purchasing one of these radio. I would like to use it in the car and I am wondering what the lowest frequency I can tune into on a mobile antenna. I wouldn't want to go to much bigger than a 7-9 foot whip.

Also, is there any radio which will tune below 7mhz on a 7-9ft (or smaller) whip? I know Codan make an antenna tuner that will do it.

Thanks, Dom

Use a screwdriver antenna with a Turbo-Tuner...then you can use the 'HX
instead of the 'SAT. That extra 100 watts comes in real handy especially in
the mobile. Talk to the folks at Tarheel antennas.... they did right by me.

Dom-

My TS-480SAT can tune the 40 Meter phone band, but only 1/2 to 2/3 of the 75 Meter phone band using the appropriate Hustler resonator and mast.

You are asking too much of a built-in tuner. The specs of built-in tuners usally say the antenna must have an SWR of 3:1 maximum. Because of component values, they may match a wider range on the higher bands, but not on 75 and 40 Meters.

To do what you want, you should consider N6OJN's suggestion, or look at one of the separate tuners that companies like Kenwood and Icom have for their respective equipment. MFJ, LDG and SGC also make external auto tuners.

I don't know what he really designed. It appears to be a standard 12 volt amp kludged onto the back of a 12 volt power supply. Of course, he did add some kind of metering, and moved the control switches to the front of the power supply, but if that's designing, I have designed cars, computers, and of course every home I have lived in since I could push a dresser around.

To further this, according to 47CFR95 its illegal to even have a CB
amplifier in your posession.

Wrong. You can own one, you cannot have it connected or transmit with it.

Spend a couple of bucks, buy Code of Federal Regulations 47, then *read*
part 95, as well as part 97. Then maybe.....

BTW.. the book is available through the US Government Printing Office.
http://bookstore.gpo.gov/dynamic/actions/GetPublication?stocknumber=869-056-00196-7
You should really have one in your shack for reference material so you will
actually have a clue.

Can he use it when transmitting into his dummy load?

Not a real Bird dummy load but one of them
10,000 W ERP verticals attached to his truck
with the genset trailer to power the entire setup !

Yes, the 10Kw vertical with the tophat that
you find on ebay all the time, hooked up with
rg8 'belden' brand (no markings on coax !)

650. New Program : OP_ANGLE

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-15 17:54:45 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <dsvpt5$9er$1@nwrdmz01.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 11136

New Program - OP_ANGLE.exe

This program assists with understanding, choosing and setting the
operating angles of Class-B and Class-C RF power amplifiers.

The operating angle underlies all performance characteristics.

Although RF operating conditions for tubes can be set up using
manufacturers' data sheets, the program refers to use of a tube's
Operating Characteristic Curves.

Download program OP_ANGLE in a few seconds from website below. Not
zipped up. Run immediately. File size = 39 kilobytes.

....

The FCC has taken the stance that: "possession is sufficient to prove
guilt".

so, even *if* you don't have one hooked up, you are still in violation of 47
cfr 95 et al while in possession.

care then to explain the fines they have issued over the last 10 years or so
to folks that were heard on the air, but were found not to have said
"linears" hooked up? they still got fined.

even though 47 cfr 95 doesn't explicitly state it, if you are caught with an
amp in your possession, you are as guilty as someone who uses one. end of
story.

another concept you should wrap your brain around: "guilt by association".

I have a TS-450S (no tuner) and and SGC SG-237 Smartuner. The SGC needs only 8 feet of antenna down to 3.5MHz. I used this setup in my camper, and it did OK. If you're interested, both are currently up for auction on eBay. Sold the camper, and not interested in mobile operation.

You 'only' need to receive the C-band link to the LES, there's no magic
in the data, it's straightforward Inmarsat-C transmission.

Actually they were adapted from some motorola tech notes. He wrote the
parts list, the girls built them. These were full production units until
FCC signal purity regs were instituted. They were good for heating up
external low pass filters. Beleive it or not I think the company is still
in business.

Yes he had a cb in his car. I don't see his call in the dbase any more.
Probably deceased.

hey there,
im pretty keen to start recieving severe weather warnings via marine
vhf. just wondering if theres any electronic hacks involving modifying
an am/fm radio? im handy with a soldering iron, so im not afraid to get
stuck into it.
cheers,
cameron

>stuck into it.

I'm sure it's possible, but it's not uncomplicated.

The NOAA weather radio frequencies are in the 162 MHz region (162.400 through 162.550). It would be necessary to figure out a way to re-tune a standard FM radio (probably changing both the front-end bandpass tuning and the local-oscillator tuning) to extend the radio's tuning range upwards from its normal limit of around 108 - 110 MHz.

Perhaps more complex is the fact that the NOAA channels use narrow-band FM modulation - the channels are only 25 kHz apart, and so the carrier deviation is probably limited to +/- 12 kHz or so. That's far less than a standard commercial FM station, as these are usually 200 kHz apart and use a much wider carrier deviation.

The difference in modulation has at least three implications. One is that you'll have to adjust a standard FM radio's tuning knob _very_ carefully to get the NOAA channel centered in its bandpass, and the FM automatic-frequency-control circuit may interfere with you. A second is that you'll probably find two or more NOAA transmitters sitting within the receiver's bandpass - you won't be able to tune into one and eliminate adjacent-channel interference from the other(s). A third is that even if you do get the signal down to a single channel, the audio output level will probably be very low due to the narrow deviation of the carrier.

It'd probably be cheaper and easier to find an inexpensive AM/FM/weather radio which has this feature built in, or perhaps to find a specialized kit.

I agree with Dave, and decided to look at Ramsey kits; not the
cadillac of the kit's that have been available over the years but
workable. They have a VHF receiver that is listed as a 2 meter
amateur receiver but is tunable to any 5 mHz section between 130 and
180 mHz so it should work. Cost is under $50 - of course you can also
find pre-built weather radios for less but then you miss the fun of
assembling the kit.

It sure came in handy the last couple years right after the
hurricanes ripped down power poles and electric lines here in Marion
County, Florida. No electricity, roads closed and no stores open so you
ate cold canned goods. i have a dozen cans already for this year's
hurricane season, along with a couple large jars of peanut butter and
several boxes of crackers. It was weeks before the stores had fresh
fruit and vegetables, or much of anything else. :(

Can a Heath GD-1B be safely powered from a DC/AC power
inverter? I know the output of most inverters is a bit "dirty" so
I don't want to do it if it will harm my GD-1B.

Sec. 95.411 (CB Rule 11) May I use power amplifiers?
(a) You may not attach the following items (power amplifiers) to your
certificated CB transmitter in any way:
(1) External radio frequency (RF) power amplifiers (sometimes called
linears or linear amplifiers); or
(2) Any other devices which, when used with a radio transmitter as a
signal source, are capable
of amplifying the signal.
(b) There are no exceptions to this rule and use of a power amplifier voids your
authority to operate the station.
(c) The FCC will presume you have used a linear or other external RF power
amplifier if--
(1) It is in your possession or on your premises; and
(2) There is other evidence that you have operated your CB station with
more power than allowed by
CB Rule 10, Sec. 95.410.
(d) Paragraph (c) of this section does not apply if you hold a license in
another radio service which allows
you to operate an external RF power amplifier.

Note that (d) allows Amateurs with HF privileges to posses amplifiers.

I know of no "CB only" amplifiers. I own several intended for CB purchased to use with QRP rigs years ago. All work fine on 10m, most on other ham bands down to 20m. I'd bet the "awesome varmint" does too. One should also use a lo-pass filter to avoid the harmonics these cheap amps are prone to generate.

>I don't want to do it if it will harm my GD-1B.

I rather doubt that doing so would cause damage, as the power supply
is transformer-coupled.

I'd be more concerned about incorrect or flaky operation. The GD-1B
doesn't appear to have particularly good RF/EMI filtering on its AC
supply... there's just a single-stage R/C on the high-voltage DC and
none on the filament. A stepped-square-wave inverter would probably
end up dumping a lot of HF hash into the circuit. This might cause
the oscillator/detector to misbehave in any number of ways - the meter
might jump around a lot as you tune, or the oscillator frequency might
"pull" to the frequency of one of the inverter harmonics anytime you
got near it, etc.

You might be able to improve matters by installing a hefty,
high-attenuation RFI/EMI filter (such as the sealed-in-metal modules
sold by Corcom and others) in between the inverter and the GD-1B.
Adding some EMI filter components inside the GD-1B might also help...
ferrite beads on the mains wires, some .01 uF - .1 uF mains-rated
filter capacitors across the primary and secondary transformer
windings, etc.

Thanks, Dave! Lot's of great info. I just bought a mint GD-1B in the original box with 7 inserts. I understand what freq range the 1st 5 inserts do as they are marked and there is a picture in the manual. Problem is the last two inserts - they have a lot of wire (looks like AM antenna micro wire). One has 1 coil of wire, the other 2 coils.

Unlike the regular coils, these are wound inside the plastic form and sealed. Any idea what they are for? Is that the 341-A coil set? How do I use them (what range)?

Thanks again....

Hi

I've bought a second hand Kenwood TM241. The problem is that the only sign of live at the front site is the burning DIM led. Further there's nothing burning. All the buttons function well and are beeping alright.

Does anyone know if there is a possible failure or is it possible that the old owner switched of the display in some way, it was used in a cab/taxi.

Hope someone knows a sollution.

Kind regards,

Marco (mkalmijn@yahoo.com)

That sounds like a really nice find! I'd be very interested to learn
how you find its sensitivity. There seems to be a big range in dipper
output and sensitivity, with most of the modern transistorized units
coming up looking rather wimpy compared to classic firebottle types
such as the Measurements 59.

> I understand what freq range the 1st 5

>How do I use them (what range)?

That's probably the additional coil set mentioned in the manual (which
you can download from http://bama.sbc.edu or its less-heavily-loaded
mirror site at http://bama.edebris.com/

The standard set of 5 coils goes down to 2 MHz. The manual says that
the extra coils extend the frequency range to 350 kHz, but doesn't say
how many coils are included in the extended range. Since it appears
that each of the coils in the standard set covers a frequency range of
about 2.5:1, I'd guess that one of your extended coils covers from
somewhere around 800 kHz up to 2 MHz, and the other covers from 350
kHz to 800 kHz. The one with more wire, is probably the latter. You'd
use these coils in just the same way that you use the other five.

If you have access to a reasonably sensitive RF frequency counter it
shouldn't be difficult to confirm this. I use an MFJ 269's freq-counter
function, with a few inches of wire soldered to a BNC connector, in
order to do fine calibration of the output of my Measurements 59 grid
dipper. Just plug in the coil, turn on the dipper, hold it near the
frequency-meter wire probe, and the probe will probably pick up enough
RF to give a good indication.

Excellent. In my experience, as a general rule, the dippers having
higher output can achieve a usable dip with looser coupling to the
circuit being measured... which means less pulling of the oscillator,
less parasitic loading, and a more accurate measurement overall.

Radio Specialty Model 1179-22-1 Repeater------------------$ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed, but inside is very clean!
Repeater is in a wall mountable battleship gray cabinet,
that is 4" deep by 13.5" wide, by 21.5" tall, and is
around 30# in weight. It is a VHF base/repeater used by
the BLM out west...
It also has on the front cover, I-5YACC, then under it is
271, under that VHF REPEATER. There are a lot of FCC type
acceptance # all over inside, plus the maker, and maker's
partial address, and part # for transmitter, and receiver
sections.
NO documentation.

1 Comspec TS-32P-----------------------------------NEW----$ 35
New never used in original package complete with tuning
tool, wire jumpers, switch chart for pl tone, and mounting
tape plus original documentation/schematic.

2 Kenwood TR-7950----------------------------------EACH---$ 80
Each comes with mobile mount, and 1st sale gets the
packet adapter. Are in very good shape, but do not include
the TU-79 PL boards which are available at www.piexx.com
They will not come in original box, and if I do not have
the manual, I will photocopy, or pdf one (your choice)...

LinkXcel PS-141B 4 port KVM Switch with 4 cables----------$ 65
-Like New- This is the PS2/VGA model -No manual-

Pioneer DRM-602X Scsii cd changer that uses Pioneer--------$ 15
audio cd carts. -No manual-

Sanyo SCP5000-------------(Sprint)-9/10---------------BEST OFFER
1 desktop charger
2 AC adapters
2 12v adapters
1 data cord

Samsung SCH3500----------(Sprint)-6/10----------------BEST OFFER
1 extra battery
1 holster
1 desktop charger
1 12v adapter

1 data cord

Well I for one can understand partly the reason why. It was nigh
impossible to get a Radio Shack catalog in any way shape or form. This was
and is a big part of why we dont use Radio Shack much any longer.
I managed to get one or 2 old catalogs by asking each Radio Shack
if they had old ones under the counter they could give me. This
is why I petitioned "Mouser" for a catalog and they put me on their
list so I should be getting an updated catalog every quarter.

rgds-

It could be as simple as a high SWR, with RF in the shack.

For example, RF energy might be picked up by the speaker cable and coupled
back into the speaker audio amplifier. It could be also coupled through
the microphone cable.

RF energy can over-drive an audio amplifier so that it amplitude-detects
the signal. I can imagine that the "Donald Duck" sound of SSB would
appear as distortion in the transmitted audio.

The parts I've bought have been good quality. The alternative is to buy
on the internet from Mouser, DigiKey ect. You will pay postage and
shipping and it will be far less handy. If I need a phono jack or plug
now, I can drive a mile and a half and have it here in 20 minutes. From
a mail order place the shipping will cost more than the part and it will
take several days. I also like their scanners.

I hope they don't close the R/S near me.

I guess I must be blessed as I have a "real" electronics parts house only
about 10 miles away... there are 4 RS stores between here and there. For me
its well worth it to drive the extra miles to get quality parts and
connectors. The last batch of PL-259s I got from RS were all garbage. Every
last one BROKE when screwed down even "finger tight". Their coax is *maybe*
50% shielded.... yeah, real top quality stuff at twice the price of Beldon
RG-8 foam at the "real" supply house. No I don't have a lot of use for RS
anymore.

Source record: 11094

Hi.
Thanks Rick for the offer.
I will need to tune as low as 2.020Mhz which is 1 of the emergency
frequencies on the system I am using.

The antenna needs to be very robust as it will be used on a 4WD. Codan
and Barrett specialise in this area but it's hard to find just the A/T
antenna!

I'll do some research into the screwdriver antennas and turbo tuner.

MoonRaker does a great antenna. Here is a link for those interested in
a 2-30Mhz auto tune antenna which is less than 9Ft tall!!!

http://www.moonraker.com.au/ftp/at230.pdf

Thanks, Dom

About the one who mentioned the expense of shipping vs Radio Shack
local stores. Dont forget the "sales" taxes in most states can
override that factor. We call them "Excise" tax in Hawaii and
believe me shipping from USA will be much cheaper than our
Excise taxes specially on the higher priced items.

For sure Nearly 10% sales tax here in Tenn.

I go to KY for much of my shopping and I plan on buying all my new radio
gear
via catalog OUT OF STATE. Free shipping most places.

712. Help - Kenwood TH-D7 - off frequency

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-19 15:31:52 UTC
From: News <VE3DGE@hotmail.com>
Message-ID: <Ib0Kf.52$XZ3.10794@news20.bellglobal.com>
Source record: 10998

Thanks for reading this. MY TH-D7 is off frequency by about 1 khz on 2M and
2.5 khz on 440. I suspect that all it needs is an adjustment to the
reference oscillator. I have the equipment and skills to make the adjustment
but do not know where the adjustment is located. Could anyone who has a
service manual help me by pointing out where the adjustment is ??
I've sent this same request to Kenwood twice now and they just ignore it
after reading the email without even the courtesy of a reply.
Thanks in advance for any assistance you can render.
73,
Don

714. New program OPANGLE3

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-19 21:52:20 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <dtapak$a55$1@nwrdmz01.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 11000

NOW AVAILABLE ** New Program "OPANGLE3.exe"

Choose and set plate current operating angle for Class-B and Class-C
RF power amplifiers.

Input data includes control-grid plate-current cut-off volts, DC
negative grid bias, and peak grid drive volts.

Advice on how to use Tube Operating Characteristic Curves is included.
For interest the plate current harmonic content is computed up to the
21st harmonic.

For given DC plate supply volts and peak plate signal volts, the DC
power input, tuned load resistance, RF power output, plate dissipation
and efficiency are computed.

This is a repeat of program Op_Angle (now withdrawn) with the addition
of an analysis of conditions in the plate circuit.

Program size = 50 kilo-bytes.
Download OPANGLE3 from website below.

Technically, defefred sales tax. You are supposed to declare such
things on your state tax return where it is called a use tax. I'm
sure all Californians do just that :-)

Retired, Relaxing, and Relieved... NO TAX FOR ME....
If the Gov't likes to put me in jail for taxes... they can pony up the over
$600 a month I shuck out for meds. nearly half my SS check.
Maybe soon they will get it all. Then I can come back and haunt them
when I am gone LOL

Ok no URL... assume is com eh thanks never looked there yet.
Was considering same rig but haven't sorted out what is really needed
to run the dang thing. I have worked 10m DXCC on 100 W so no
need for the power brick to upset neighbors lol.
No antennas here yet. Restart after several
years lost in the real world.... ? no crystals? hmmm Thanks

Interesting to hear all these comments about a company the US government has provided valuable assistance from. While stationed overseas in Belgium, I worked as a radio operator. One of the radio's we used was a Collins KWM2-A transciever and it blew a tube and resistor on a vital communications link. Within 15 minutes, a new one was acquired at a local Tandy store and up and running. Our maintenance chief owes his Air Force Commendation Medal and a great deal of thanks to them.

With all due respect Sir, I happy your boss got a gold plated "attaboy", but I can't believe that your incident has happened in the last 5 years. If you walk into a RS store in these parts(south Mississippi) and ask for a tube, they will look at you like you are nuts.... then ask "A tube of what??". Their employees are clueless if its not in the latest sale flier or the catalog. Just in the last couple of weeks, I was looking for simple, basic porcelin or glass "dog bone" insulators to build a counterpoise for a verticle HF antenna. I walked in there with a picture of a couple of different styles of insulators and they were totally baffled.... never heard of them before, and never seen such. I got the same response from 4 (count'em FOUR) RS stores.

Yes, that was back when they had BOTH...
1) Good help (folk who knew a resistor from their elbow)
2) Actual corporate cognizance of what the electronics business is. In the last few years, it seems to me that the management in Texas doesn't know (or care) whether they are in the electronics business, or selling fried chicken or furniture.

Interesting to see the rise and fall in my lifetime. As a teenager in high school, I remember Radio Shack taking over several of the local electronics stores in town (Orange County, CA). To be sure, the ~schlock 5 resistors in a plastic bag on a peg type places, not the really serious electronics suppliers. RS never really had a "Golden Era" IMHO, but they made it to Bronze there for a while.

They started going downhill when some management "genius" decided they
wanted to meet the needs of a different clientele. They carried out his
policy by moving circuit components to the back of the store and brought in
new stocks of radio controlled cars, cell phones and TV/stereos in the front
of the store. See
http://www.forbes.com/business/2006/02/17/radioshack-edmondson-retail_cx_tr_0217radioshack
.html
for info on their CEO David Edmonson

I am looking for all filters for an omni V or Omni VI.

Specifically looking for 250/500/1.8 for both i.f. frequencies.

Model 218/219/282/285/288.

Inrad alternates ok, too.

Let me know what you have and price please. I CAN do Paypal.

Please contact me direct at My callsign @ yahoo.com.

Thanks.

K8VF

It might be worth posting on the Ten-Tec list. People buy and sell filters
on that list almost every day. See
http://lists.contesting.com/mailman/listinfo/tentec

US companies (*perhaps* companies in other countries too, but probably to a lesser extent) don't care whether their CEOs know anything about their particular products or services. Someone can go from a fast-food co. to a computer co., to an automobile manufacturer, to a health-care corporation, all the while knowing very little about the specifics of the industry and getting a salary and benefits many times (hundreds of times?) more than the CEO of a European company who actually has a degree in electrical engineering or whatever is relevant to the company's products.

~~~~~~
Your maintenance chief did not have a spare tube and resistor on hand
for a "vital communications link"? Had I been his superior, he would
have gotten something far different than a Commendation Medal!

Mr Bill

Ref Radio Shack. does anybody on here remember the 1st Radio shack??
The one called "Boston Radio Shack". It was the only one in the
country and it was the original one. I was told the new Radio shack
bought out the rights to the title. The old Boston Radio Shack was
truly a hams delight back in the late 30's.
They had Catalogs available for a postage stamp too something
present day Radio Shacks no longer offer.
Joe

Folks times have changed -- todays youth could care less about RF, SWL, Ham Radio, homebrew, experimenting.
To keep solvent, RS has catered to what sells -- cellphones, IPOD/MP3, toys, some Audio and TV etc.
The demand for parts, tubes, antenna parts etc has fallen to zilch.
As far as the clerks -- minimum wage.
I have always sed - "don't expect a EE answer from a $5.00 an hour clerk"
Bless their hearts - some of the clerks really try hard and quickly learn about the products

And I talked with a RS store manager -- the lease rates for store space is out of site and some landlords want a percentage of the profits !!!
No wonder mail order parts is about all that is left
--
CL -- I doubt, therefore I might be !

Source record: 11024

FS A nice Kenwood TS-820S. This is the one with digital readout. The transceiver has been stored for
around 10 years and not been used a lot. It is from an estate. It looks and works great. It has full output from the original tubes. It would be near perfect except that the plastic extension for the Noise Blanker toggle switch has come off. This is a push on type extension and can be easily replaced. The NB switch can be operated like it is. The original manual is included along with the AC Power Plug. Price is $345. Thanks, Charlie Hugg, K5MBX

It was still a great place to shop in the late 40's and early 50's. Lots of surplus on the ground level and then I think the ham stuff was on the mezzanine. Somewhere in the early 50's, I remember seeing ads for the Cosmophone desktop kw/receiver. I wonder if any of them actually were sold.

I have the following Kenwood Accessories for sale:
1.SP-820 Speaker with filters. Works great. Looks good, few small scratches.
Price is $75;
2.SP-520 Speaker. Works great. Looks good, few small scratches. Price is
$55;
3.SM-220 Scope with BS-8 Pan Adaptor. Works and looks good. With Manual.
Price is $350;
4.MC-50 Mic. Works and looks great. Price is $55.
5.AT-200 Antenna Tuner. This tuner needs some work. The link between the
R-Tune Capactor and the Front Knob needs replacing and two of the toggle
swithces are loose and will need some work.
Otherwise it is working and complete. Price is $55.
Shipping not included. Actual cost only. Thanks, Charlie Hugg, K5MBX

Caveat Lector this is for you buddy. If you think ham radio
and MARS/AARS/Marine Mars is out of the picture nowadays I suggest
maybe you had your head in the outhouse hole in the board.
WW2 was actually fought by COMMS guys of all kinds mostly
hams. Its still being done today in IRAQ and Afganistan
and its those same hams and descendants of Hams that are
doing the job both in the military and in the Volunteer hams
such as I am one of. So think twice before you rave on.
I have a QCWA certificate showing continuous service for 70
years as a licensed ham. So cut out the snootty attitude!
Joe/KH6JF
P.S. I dont have a cell phone and never will. I dont have
cable tv and never will. I dont have a VISTA computer
on the internet and never will. I used my head and stick with
my old Commodore 128 which is totally imune to any virus ever
created or could be created in the future. Its my internet machine
and will remain so for that reason. I have 4 laptops which I enjoy
for listening to my favorits music while I play Solitare!!
Hence I dont pay for constant upgrades of virus software every
few months either.

Heh!! What make you think it is only the CEO's?
This last year before Mom passed away I had to go to a
drugstore (where they are SUPPOSE to be educated)
and it took 4 trips to get one prescription filled correctly. I find the
same incompetence at nearly every turn of the consumer
trail. I am not even sure they require a reading and
writing skill anymore. If you guess you way through all
the "computer applications" the stores have, your in.
Stores with workers wearing "How may I help you" on
their work clothes and then rush past you like you
were not even there. Ok.... let me see if this spell
checker works.....

Get a Turbo-Tuner... Its really the way to go.... I have the 480HX with a
Turbo-Tuner on a Tarheel M-200 and its really a great set-up.
Its almost completely "plug and play". I have pics posted in the Yahoo
TS-480 group.

no restrictions that I know of beyond those of any other antenna...length of feed lines and control cable etc.
What are you going to use for a counterpoise?? Where's it going to be located??

no worries I was a member before, I will rejoin, I cancelled all groups
subs,
ok well all BIG antennas and BIG AMPS have GONE, everything was rotatable
once, well had a spack attack and a silent protest in rgds the hobby, and
just getting soemthing to have a play with,
counterpoise is a fully tuned radial test bed, 10 radials for each band
the 160/80/40/20 Mtr radials are 1 7/8' x 1/8 " Power Station EARTH MATTING
ROLL, I would have at the very least 12 cwt of copper in the ground, have a
1500MK2 mounted on a 2" ally tube 7ft 6" above gnd, with a 2" x 1/4 " flat
strap to gnd hehehe, with 4 x 24" SS CAP Top hat tig rods, above the coil
with a 3ft whip, still too long to tune above 18Mhz, but working on a happy
medium, still got 4" of coil in the Mast at 3.670 Mhz, with above setup,
should trim the CAP HAT a little,
I should mention I had HS-1000 in my car back , uuhhmm not long after Jim
started making them, would have been numbered in the 100's I was talked out
of it by a friend haahah, some friend caught me at a weak moment back in
2004.
I would have had a TARHEEL but Cindy wanted $275.00 to post to VK, I got a
MK2 1500 posted from VA insured for 400.00 for 75.00 USD, Global express,
42"x5" @13 llbs, 75.00 USD anyhow thats life
I appreciate the info, unsure of what 480 as yet, don't need 200WS and
don't need TUNER ?? ahaha,
need 150ws unit without tuner ahahah
tnxs

very nice setup, your rig
my antenna is about 35mtrs from shack, I don't have any trouble tuning it
now, so the turbo-tuner and the dc supply from the 480 should be Ok ??

758. Icom IC-821h

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-21 02:14:31 UTC
From: Paul Proefrock <proefrock@heartlandREMOVEgroup.com>
Message-ID: <bluKf.23114$_S7.3969@newssvr14.news.prodigy.com>
Source record: 11046

I am looking for a schematic and service manual for an Icom IC-821h.

So far, Google has not been my friend. Does anyone know of a source for these?

Thanks

Paul P
K0PRP

you know, fed up with the hobby, what every ham goes thru at least once in
their life, lost interest, etc etc,
sell all your gear, feel remorseful, get back in the hobby agn, you know,
normal ham actions ahahha
get ripped by other HAMS, after helping for years etc, we call it a Dummy
Spit in VK, ahahha, well I had a BIG dummy spit,
1000D, 2 x 1000MP, 990,900, 2 x 857's, 2 x120atas, hs1000, 2 x dx-2 amps,
tl922, 2 x fl7000's, thats a pretty big dummy spit in anyone's language
ahahha

> but do not know where the adjustment is located. Could anyone who has a
> service manual help me by pointing out where the adjustment is ??

Don-

Go to http://www.mods.dk/ and click on Kenwood on the left side of the
screen. When that comes up, click on Manuals at the top of the right side
of the screen. Scroll down to "TH-D7A-E Adjustement manual.zip". It may
have what you need.

763. FS RFC 2-417 2mt amp

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-21 03:31:25 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <hQvKf.164517$WH.130669@dukeread01>
Source record: 10951

RF Concepts RFC 2-417 2-meter linear amp. Input power just right for a Yaesu FT-847 and most mobile radios: - 45 watts in, 170 watts out on 144-148 MHz. - Works for AM/FM/SSB/CW. - Switchable GaAs FET preamp. - Has RF sensing keying. - Switch for SSB vs. FM RF sensing keying. - Has connector for external PTT connection. External PTT jumper selectable "+" keying or "ground" keying. - 5-pin DIN connector for remote control. - Automatic thermal shutoff. - Automatic shutoff when SWR > 3:1. - Indicator LED's for power, TX and protective shutoff. - Includes "Jones" connector for power. - Includes "L" brackets to mount under shelf. Amp is in very good condition, dusty from sitting around. $175 shipped to lower 48 states.

Ahhhh....I see, you had a serious case of the "dumb shits". I did that once, but not quite to that extent.... I kept the basic rigs and some wire antennas, a power supply.... just the bare bones station to get on the air in an emergency. I had gotten rid of all my packet stuff, tower, antennas, SB200, a couple of spare 2m and dual band rigs and handies.... then there was all the stuff in the junk boxes.... that was the worst part of it.

Apparently in Radio Shack's case, they don't even care whether their
CEO's even went to college. The just-fired CEO lied on his
resume...instead of the standard MBA, he received a ThG (whatever that
is) after 3 years in some institution.

A theology degree.

Say hallelujah!

john

Because some of the freqs. above ch 40 are military. We had a kook out here
who was ripping up for three years telling the FCC to FO his doorstep and
telling them they had no authority to fine him some $50K or more, but he
strayed onto Military frequencies and within two weeks the FBI raided his
place and trucked him and his stuff away. Looks like they will be selling
his house to pay for it all.

770. APRSPoint president's day sale

From: Michael <ccc73571@vip.cybercity.dk>
Message-ID: <6AsKf.5690$x5.4902@news.get2net.dk>
Source record: 11035

My name is Michael. I'm educated as electronic mechanic. I started a project with the goal to receive and decode the VMS signals from Inmarsat. VMS system is manly used on fishing vessels. On the ship there is a box with a gps and satellite transceiver. The
position information is send each hour, to a land earth station, were it is distributed to the different authorities. I hope that many of you will help and contribute to get this working, because I don't have all the skills my self.

First I started to ask people in different news group about the subject. But I now realized that it will be a bigger task. So I have made a Yahoo group to get this thing going. I have in this group posted the information I have gathered until now. If you think you maybe can contribute to the project then, or is interested in this as well, then please join at

http://groups.yahoo.com/group/vms_group

Cheers Michael

Hi ken. Can you explain a bit more. What kind of software do I need.
what modulation does the VMS use. FSK? PSK? GMSK?

What is the baud rate/bps used. Maybe only one, standard, used
on Inmarsat?

How are the packets constructed. Protocol specification
will be needed. Sync, frame & block lengths, checksums etc?

I agree. I was a broadcast engineer for AFRTS in the early '70s.
Even though everything was considered "Depot level only", I kept our AM
radio and VHF TV stations on the air with what parts I could get through
the supply channels, and what I could scrounge from junk TVs and other
available electronics. I don't think there was a Radio Shack within a
day's drive, and the parts house in Fairbanks carried TV repair parts.
I even made a replacement tuner for our off air "Demod" used to monitor
over the air video and audio from parts of a junked Motorola portable TV
set. I got a promotion and a letter of commendation for my efforts.

I will miss them if they go away altogether.
I remember when I was 13 living in Columbus Ohio. If I could get a ride downtown it would only be on Saturday morning. Some of the Radio-Electronics Stores were not interested in selling a kid anything.

IBM was five years behind Radio Shack with the PC. Some of the RS folks are technical, some are not. I have always found them willing to work with me. I hope for a restructure that keeps the parts available.

Parts??? Your RS has parts?? The RS stores around here are doing good to
carry a switch or knob.

Your profound ignorance is showing. With a good virus scanner integrated
into your news reader, the malware is identified and blocked before it can
do any harm.

There's never any need to "open" it, newbie.

Newbie? That's almost funny. Not all news servers leave infected
attachments on messages. Also I have Java and Javascripting turned off
in my news reader.

On the other hand, if anyone on this group knows anything about
profound ignorance...

A switch or knob? Phooey! The last time I was in a RS a couple months
ago...
I wanted a rubber foot for a power supply (not the stick on ones... a set
of feet with 4 screws) they said I should ask at a Lowe's or Home Depot.
RS used to have construction boxes and the works. Now all you see are
TV's Satellite and cell phone and tunes contracts.
Last year they fell short of having cleaner for switch contacts...
I guess that went with the tubes and the old mechanical TV tuners.
Sorry dating myself a bit LOL RIP RS
They also recently failed on a simple 4 prong spade lugs power connector.
If they go down the toilet,,, it isn't because Hams have let them down.
We all still go to RS and wish I think.
This last months QST had a project that built a portable mast into
a bucket of cement... all parts from Home Depot... Suppose RS has
give up masts too in favor of Sat' contracts.

Why do they have to be located in a mall? Sure, there is a lot of
foot traffic, but the rent is high, its usually a a long walk from
wherever you can find to park, which takes more time to get to the
store, find what you need, and get out of the place. It doesn't make
sense to me. The older stores that were somewhere near a mall or large
shopping center always seemed to have more people than the stores in the
malls.

Because that is the "ideal" model of modern mass-market
retailing. If that model doesn't fit your business, then change
your business to fit the model.

Fortunately, my company is built on giving my customers top quality service and a top quality product and does not fit the modern retail concepts. I guess thats so I don't end up the same way as RS. FWIW, I have been in business for 10 years. Even though the economy has supposedly been in the dumper for the last couple of years, you couldn't tell that from my books. A lot of people are getting a little fed up with the big box stores and their lack of service. "Mass-market" retailing isn't all that its cracked up to be. You might could save a few bucks, but when it comes time to service, repair, or install..... well.... lets just say that soon they are going to have to outsource those tasks to India... the service calls and milage charges are gonna be a killer when that happens.

The key word being "supposedly". Alas, the mainstream
media has failed us in accurately and impartially reporting
news about practically anything, the economy included.
Most of us are equally puzzled when trying to correlate
first-hand experience with what the MSM is trying to
tell us.

I've read that traditional malls are on their way out. Our local one is
half-empty, while stand-alone stores are springing up all over the place.

807. How to fix my TS-950SDX? Please help...

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-23 22:37:40 UTC
From: adibene@yahoo.com
Message-ID: <1140734260.174211.187340@j33g2000cwa.googlegroups.com>
Source record: 10993

Hi everybody. My TS-950SDX has suddenly died. Powering it on, only the S-meter and the small ticks from 0 to 1000 under the frequency display do light up. No other indication on the display. Pressing any buttons does not produce any reaction.
I opened the rig, checked the backup battery, and it still is at 3V. Clipped an oscilloscope probe to the address and data pins of the CPU on the Digital board, and there is activity. The crystal of the CPU oscillates fine.
I even removed the EPROM (a 27c512), read its contents with an eprom programmer and compared it against the image of another eprom I knew was good. They were identical.

All the symptoms indicate that the Digital board is unable to control the rest of the radio.
I have the Service Manual, but frankly I am stuck... don't know what to check next. If anybody of you is knowledgeable about fixing this rig, please help me. I like this radio very much, and would hate having to depart from it... thanks in advance.

There is something about unbuilt Heathkits. Some people collect them,
and never build them. Weird. Then again I know people who collect
Barbie dolls and never open the packages, just leave them on a shelf to
collect dust.

I suppose as in most cases of sudden death the first things to check are the obvious, i.e. the edge connectors, see if there are any subcircuit fuses that may have blown and look for any signs of an electrical smell or signs of burning.
I'm sure you will have looked at most of the above items Alberto, but it does not hurt to remind one just in case.
Good luck with your task, I do hope it's not a real big problem to resolve.
I had a 'TS 950SDX' (and the 950 original) and loved them both, more so the 'SDX' of course.
All the best, Ken, G4KIR.

--Solder smoke in space
--The Simpsons on social skills of Radio Shack customers (us!)

Listen at: http://www.ourmedia.org/node/168474

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.

http://www.ourmedia.org/mediarss/user/36170

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.ourmedia.org/node/168474

Here's the homepage for our show. All our programs area available here. There is also a blog and links

to some of the sites and documents we've been discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

73 from London

Source record: 10902

The TS-440S has a simular problem...most all have had to go to the shop for repairs....has to do with removing the goop from the PLL board, and re-aligning. It seems that over time the goop becomes conductive and causes the loss of PLL lock.
This is not something to be attempted unless you have some serious patience, a couple of dental picks, a large magnifying glass, and a lot of time on your hands.
But then I could be wrong.....your milage may vary

What kind of 12amp choke can they put in there when the whole thing
costs $4?

More importantly, what ferrite toroid material and how many windings
should I use for my choke? It would appear that 4700 uF is often used
for the caps.

825. squelching TR751

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-24 23:07:52 UTC
From: WBY <brianwoodbury@cbgazette.com>
Message-ID: <867a7$43ff91ce$a666cc06$475@ALLTEL.NET>
Source record: 10911

I have a TR-751 2m allmode mobile and when power is first applied you'll hear about 1 second of USB "hiss" which fades into squelch. Turning the squelch control does nothing at that poin, it's all squelched. Strong signals are heard, so I know the RX is okay. Using a dowloaded copy of the service manual I tried a few things, and while adjusting VR14 "Tight Squelch" I accidently also touched the chassis (thus it was grounded). Squelch went away and hiss was normal. Unfortunetely, the schematic is blurry so I can't trace (or for that matter, even FIND VR14). I was thinking it might be a capacitor, which would account for the hiss and quick fade into squelch, but with the blurry schematic - forget it. So, does anyone have any idea if it's okay to just permanently ground VR14? I realize I won't have squelch for FM, but I only bought the rig for 2m SSB.
TIA
Woody

My own view: we all work so hard, we don't have time for "casual
shopping". It's more like 'surgical strike" shopping. Park, go in and
buy something, get out and go home (or to the next destination: fast
food?). Thus, malls are on the downturn and single stores clustered in
strip malls now seem to dominate.
No time to just shop...destination objective reached, egress and head home.
Our economy is based upon significant consumption...I think we're
entering a new era where time management is at odds with consumption
(and spendable income is decreasing)...Americans are working harder and
longer, yet their income is stagnant or decreasing.
CEO's excepted.

watch out retailers and consumers!

832. ICOM 740 PROBLEM

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-25 13:17:36 UTC
From: Don <jlrdcr@velocity.net>
Message-ID: <1140873456.391809.10810@t39g2000cwt.googlegroups.com>
Source record: 10918

Does anyone have an easy solution to the following problem?

ICOM IC-740 10m-160m 100 Watt HF Transceiver. NOT IN WORKING ORDER. the radio powered up as it should, with the analog meter lighting and reacting to incoming signals, and the large, bright LED frequency display looked great. The large dial WAS rotating through frequencies, the frequency band switch WAS switching, the squelch WAS working and the radio WAS receiving and sounding great BUT it IS NO LONGER WORKING AS IT SHOULD. As soon as I turn the radio on, it shuts itself off. I see the lights and hear sound for about half a second and then the power just dies. When I turn the on/off switch off, then repower up, it comes on again for a split second.

Thanks very much,
Don, WB3DNF

Lots of places on the web that have service manuals for your radio. Even the basic owners manual for the radio should have the mic pin-outs.

Source record: 10921

I had one with the same problem. I have since picked up another one that is in mint condition (I do like these rigs).
Anyway, the cheap, cheap, cheap (read junk) pots that Kenwood chose to use for the volume and squelch controls have a tendency to vaporize over the years. What you will find is that the center wiper is probably not making contact with the resistance material.
A good way to confirm this is to hardwire (with a jumper) the center wiper of the pot to either end of that pot. One position will give full squelch while the other will give open squelch. I do have an extra 751 main board so if you figure out which part you toasted I can send you that part.
Don't feel bad.....I went through the same thing with my parts unit before it became a parts unit. The thing that fooled me was that the squelch pot is on the front section of that concentric volume/squelch pot.
The rig was in pretty rough shape cosmetically, so it wasn't a great loss when I scrapped it.

Pete

I have just posted the following manuals for auction to ebay under
phiscock3sct. All manuals are in good to excellent condition and starting
bid is $2.

Dumont 248 oscilloscope.
Dumont 304a oscilloscope.
EA analog computer eai-tr-20
Fluke8000A voltmeter
Heathkit analog computer.
Heathkit grid dip meter gb-1b
HP 1200a oscilloscope
HP 1801 vertical amplifier
HP 1821a timebase
HP 3310a function generator
HP 5221 electronic counter
Khrohn-Hite 5100b function generator
Philips PM2522 voltmeter
Philips PM3110 oscilloscope
Philips PM3230 oscilloscope
Philips PM3410 sampling oscilloscope
Philips PM6507 curve tracer
Tektronix 2b67 timebase plugin
Tektronix 3a1 vertical amplifier plugin
Tektronix 3a6 vertical amplifier plugin
Tektronix 3c66 carrier amplifier plugin
Tektronix 511a oscilloscope
Tektronix 564b storage scope
Tektronix 564 storage scope
Tektronix 575 curve tracer
Weston catalog and technical description of moving coil instruments

839. KA9Q software applications

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-25 22:46:30 UTC
From: drwho8__NOTME__@att.net
Message-ID: <a75Mf.460604$qk4.100159@bgtnsc05-news.ops.worldnet.att.net>
Source record: 10925

Hello!
It seems I have been put into an unsual position. An amateur radio operator who's something of a noob when it comes to computers wants me to setup the NOS (KA9Q and descendants) package to be a server for both TNC hardware, and to accept dialed connections from the outside. Typically the whole setup would work as a repeater working unattended. I can setup the networking software, I've done it seven or eight times.

But can it be used the same as say a BBS program back when those were popular were? And the funny part is that he's going to be using a Palm Pilot Vx most of the time to do that function.

>>
>> Went looking for a pinout of that connector... no luck yet.
>
> Lots of places on the web that have service manuals for your radio. Even the
> basic owners manual for the radio should have the mic pin-outs.
>
>
>
Well I think all the pins are doing something. Its got a touchtone
pad on the back of the mike itself, its got a scan band button, a
fav chnl button, an up/down button, a ptt button of course,
and a priority chnl button. Its not that I could'nt wire up a new
mike plug myself with a ledo lamp I can see well enuff, its obtaining
a 16 (receptacle pins) connector that is hard to find. No one locally
has such a plug.
Joe
P.S. The bronze or whatever material that forms the pin feceptacles
have lose their springiness so I keep bushing them back together with
a tiny screw driver, and spraying them with DEOXIT for good contact,
but the darned things again spread and stay spread no matter how I
try get them to cooperate after a few times of useing the radio I
start the process all over again. I suppose all the mikes and
cords for that old trusty PCS3000 fixed stn rig are in a garbage
dump tomewhere.

843. AVT 308i - Black Belt Systems

Hi everyone,
I have come across mention on the web of 10m handheld rigs much like the one
you get for CB, the names Alan and Albrecht come to mind.
They sound interesting, doers anyone know anything about such handhelds
Are they FM & SSB or just FM.
Were they just 10m HAM or CB also?
Were they any good?
Where can tyhey be gottten? I have searched the web and apart from a few
amateur home pages, I have not come across anyone selling them.

Any information?

There were just a few models of these 10m handhelds, sold under different names including Eagle Spitfire and Titan. AFAIK they are NLA. You see them on eBay from time to time for $125 - $200 (USD); some non-US sites also may have them still available.

Hi All

I am having a problem with my Kenwood 732a....I stopped working and would not power on, their was power going to the radio but it would not turn on.

I keep on trying to turn it on by repeating the on off button and now I have a small number 44 showing in the left side of the display and when you push any of the buttons all it does is beep, and now the on off button won't turn the radio off.

Any Ideas Don VE3ULF

Does the 732 have a removable head? A couple years ago my 733 did
what you describe so I took off the removable head and cleaned the
contacts on the head and the rf deck then put it back and it worked
fine.

HI, I have 2 733's and it screws up pretty much the same way every few
months.
Take the head off and rub the contacts on the head part and the radio part.
BE CAREFUL, don't break off the pins on the head. I have never had to
clean the
plug on end of the cable to the radio, just the head and the remote bracket.
Good luck... 73

First get an electrician to check your shorts. :-\

Then clean the contacts on the jumper to the face, and then do a
microprocessor hard re-set.

855. Wanted: some ARC5 transmitter parts

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-27 03:14:52 UTC
From: k5dh@qsl.net
Message-ID: <evidnT2sBuIx85_ZnZ2dnUVZ_sadnZ2d@centurytel.net>

Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

I'm looking for the following ARC5 transmitter parts:

- Antenna binding post ass'y (need two of these)
- Relay (the one underneath the chassis)
- Ceramic end plate for mounting roller coil
- Window with calibrations (clear part only)

I'm restoring a BC-459-A (7.0 - 9.1 mc) but these are
generic parts that can come from any ARC5-type xmtr.

73,
Dean K5DH

856. Programming Icom H21T handheld

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-27 03:15:05 UTC

Hi,

Can anyone help with information about programming ICOM H21T handheld?

The radio is programmable via keyboard and probably via computer.
I guess it is similar to IC-H16/U16 or IC-H10/U10.

I have tried to program it using "technician code" for H16 but it did
not work.

Any ideas/suggestions?

Thanks.

In article <57bav1p4k8f631vealjognqtu5d1pvro2b@4ax.com>,

They have a VHF receiver that is listed as a 2 meter
> amateur receiver but is tunable to any 5 mHz section between 130 and
> 180 mHz so it should work. Cost is under $50 - of course you can also
> find pre-built weather radios for less but then you miss the fun of
> assembling the kit.

Several models of Sony Walkman have WB reception, including a $30 model.
The problem with them is thy use the same bandwidth as they do for FM
broadcast reception, but will work if NOAA signal is strong.

861. Yaesu FT-767GX tech info needed

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-27 18:19:19 UTC
From: Roger Leone <raleoneTAKEOUT@sbcglobal.net>
Message-ID: <HoHMf.35676$Jd.4293@newssvr25.news.prodigy.net>
Source record: 10947

My friend Stew, WB6EYS asked me to make theis posting for him. He has a Yaesu FT-767GX with a problem with PLL2 on the "local board" (FEX-767-2). The service manual doesn't provide voltages and RF signal levels on the board; no levels in or out of PLL-2 Mixer IC. Stew is looking for RF & DC voltage levels. The chip is getting 15 mhz from the reference crystal. What is the other freq supposed to be and at what level?

Do any of you have this info or know where it can be obtained? Apparently the Yaesu folks can't help.

Or if anyone has a parts radio with a board for sale, or even a loaner he can use to make measurements and return, that would be helpful.

If you can help, send Stew an email. His email address is his callsign @juno.com

Thanks,

Roger K6XQ

862. help pls: ICOM IC-28H US to EU mod

Newsgroup: rec.radio.amateur.equipment

Hi all,

need your help to mod an old ICOM IC-28H. The rig is an US version
with 5,10,15 etc. tuning step. I need to change this to 12,5 kHz.
Unfortunately I have no service manual.

I gus just some jumpers or diodes need to be changed.

Any clue please? Thanks in advance!

863. Kenwood TM-G707A cable

Newsgroup: rec.radio.amateur.equipment
Date: 2006-02-27 19:37:50 UTC
From: Jim Leder <k8cxm@spam.fuse.net>
Message-ID: <673c4$44035520$422af2b0$14022@FUSE.NET>
Source record: 10849

I recently bought a new Kenwood TM-G707A dual band radio for the car, and found the free Kenwood memory program. I already have the Yaesu ADMS software and cable for my old FT-50R and I also have the ICOM programming cable for my IC-F420 440 radio. I really don't want to buy another cable if one of these cables will work with the Kenwood. So, two questions:
1) Will either of these cables work with the Kenwood (is the electronics in the DB-9 compatible)?
2) If so, the Kenwood uses an 8 pin DIN connector. Both the Yaesu and the Icom only use 2 wires, one for data and the other for ground with appropriate adapters. I assume the Kenwood is the same. If either of these cables will work, does anyone know the pinout on the DIN connector so that I can fashion an adapter? Any info on the net that addresses this? I found lots of info on ICOM/Yaesu, but none regarding ICOM/YAESU to Kenwood.

Thanks...

864. Logging Program with SAVE.

I have looked at numerous logging programs over the past week. Some freeware, some not-so-freeware. I thought I had settled on a pretty good piece of freeware. But you couldn't save your work on a separate disk. (No names will be mentioned cuz you ain't suppose to look a gift horse in the mouth.) But what I'm looking for is a simple logging program, that can SAVE your work on a separate disk, CD, DVD, etc. My son was fooling around with the above mentioned logging program, and lost many years worth of QSO's trying various ways to "save" my info from the log. It would be nice if someone had a SAVE feature. 73, Bill - WA8MEA - wa8mea@hotmail.com - http://HamRadioFun.com

An initial check of my info did not show any computer programming
info for the Kenwood TM-G707A cable, but I did find pinout info for use
of that jack. (you can find that at:

http://www.commtechreview.net/amaradio/g707arev.htm

BTW, you mentioned an 8 pin din.... the TM-G707A uses a 6 pin mini
din for both programming and packet.

If you can find the data info you seek, all you will need is a 6 pin
mini din and some cable..... or you can buy the mini-din and cable assy
for about $16.00. Its the Kenwood PG-5A. I use the Kenwood PG-4S
program cable, which is the complete unit for computer interface
programming... its about $32.00.

Thanks Travis

I've tried that.

I could not get my radio into "Dealer Mode" for some reason. The method described in the documentation simply does not work for some reason. I guess the Dealer Mode is locked somehow.

Programming the radio in the "User Mode" worked OK. Unfortunately the channels cannot be programmed in User Mode.

Any ideas how to get to Dealer Mode?

Regards,
Oleg VK3HOD

You need the Dealer passcode, which unfortunately I do not know.

There might be a good hint on the jpg at H21T-05.jpg right above the line "DEALER SET MODE". The handwriting is a bit hard to read but you could try several combinations and see if any of them work.

Good luck!

Also on the first file H21T-01 (front cover) there is written:

Code 3116 (H21)

Maybe that will do the trick. If so, let us know.

Sorry, I later realized it is a 6 pin DIN, not 8. Never thought about using an old mouse cable, great suggestion. But the big question remains: Does anyone know if the ICOM/Yaesu programming cable is compatible (I suspect it is). And after looking at the link Ed sent, it appears that pins 1 and 2 are the pins to use (data and ground). The ICOM/Yaesu cables do have level converters built into the DB9 head. I'm sure the Kenwood requires the same sort of interface.

Robert, Mark & Travis-

I purchased one of the Titan models (new) on eBay two or three years ago. I haven't looked recently, but expect they may still be available.

The Titan RPSY-201 has USB, LSB, AM and FM capability. It isn't a very good radio, but it works. I've used it to check into a local Ten Meter net, but it is only heard by the nearest stations unless it is connected to a larger antenna system.

Service data and possible modifications can be found on the web if you search for similar radios such as the Albrecht AE-201S, Mundara sy-201 and Cherokee ah-100.

>sort of interface.

Most of the radios I've looked at use the same electrical-signalling
protocol on their data line - basically, pseudo-TTL or CMOS, just as
if you were coming right out a UART chip. 5 volt, open-collector /
open-drain drivers with a pullup resistor on one side or the other (or
both), with the signalling sense being inverted from that of RS-232.

I've successfully used a Yaesu programming interface intended for the
VX-5 to program an Icom IC-W32A, although I don't remember whether I
needed a custom jumper/adapter to go from the Yaesu's miniplug to the
Icom's minijack.

I believe I've seen _some_ radios which use a three-wire (ground,
send-data, receive-data) serial connection, using TTL/CMOS voltages.
None of the common bidirectional-data-line serial adapters will work
with these, without some extra waving-of-dead-chickens.

My recollection, though, is that the TM-G707A is not one of these. It
uses a single data line, and should be electrically compatible with
the RS-232-to-5-volt-inverted adapters used by Icom and Yaesu HTs.

The most you _may_ need to do, is to pull one extra pin on the
TM-G707A interface to ground or +5 to indicate that you're plugged in
a programming adapter. I know that this sort of trick is needed in
order to invoke the factory-settings/alignment mode, and I have a
vague recollection that it may be needed in order to enable the radio
to distinguish between a memory-programming adapter and an external
TNC... but I could be wrong about that.

I WAS going to try to diagram my Kenwood PG-4S programming
cable/circuit,,,, but after I opened up the 26pin connector, I gave up.
The tiny PC board inside had more active components on it than I had
realized.... all tiny surface mount. A small 5V regulator IC, possibly
another IC (only had 5 pins instead of 8), and 4 or 5 transistors, a
diode or two, and a few resistors/caps.

Sorry guys, but I don't have the time at present..

Ed

883. Free Competition

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-01 00:20:14 UTC

Another Free Competition!

The Southgate Amateur Radio Club's website now has another free competition running.
This time, we are offering you a chance to win a BHI NEIM1031 Noise Eliminating In-Line Module - absolutely free.

The NEIM1031 Noise Eliminating In-line Module incorporates the latest Digital Signal Processing (DSP) technology to remove unwanted background noise and interference from speech, enabling you to concentrate and listen... ï¿½Stress Freeï¿½

The NEIM1031 will greatly improve the clarity and intelligibility of speech in a variety of radio communication applications. It is suitable for use with amateur radio equipment, scanning receivers, CB radio, two-way radio, headsets, marine communications, taxi base stations, hands-free car kits, processing of audio tapes and signals, pre-processing for voice control applications

Just answer a very simple question for your chance to win one of these super units.

To increase your chances of winning, you can make an entry every day until the competition closes. Entries are invited from all parts of the world.

To enter the BHI competition, just point your web browsers at:
http://www.southgatearc.org/competitions/bhi.htm

Good Luck!

Richard

Source record: 10877

I have have read quite few posts recently regarding power poles and I see they are featured in a article in QST this month..

I have had mixed results. In some cases, I found that replacing a "wall-wart" with a direct connection using power poles gave less protection from stray RF. In my case the RF is not so stray.. it is best described as basic overload coming from one leg of my dipole which passes right over the shack..

In any it seemed to me that the windings in the wall-wart provided some isolation that obviously you don't get with a direct connection.

Comments??

Bill, W6WLB

I'm confused. You seem to be comparing apples and oranges.

PowerPoles are a way of connecting a DC source (battery, wall wart,
solar panel, switching supply) to a load (radio). They're simply a
type of plug.

It's _possible_, I suppose, that if you break an existing hard-wired
connection, install a pair of PowerPoles on each end, and reconnect
them, that the contact resistance of the PowerPoles might possibly be
high enough to make RFI problems more obvious. Frankly, I'm dubious,
but I have to allow that it's possible.

When you say you "replace a wall-wart with a direct connection using
power poles", you don't say _what_ this "direct connection" is coming
from, on the way to your radio. Thus, you aren't giving enough
information about the topology (layout) of your power sourcing and
distribution system for anyone to help diagnose your problem reliably.

If you've got high levels of RFI on your power wiring, adding some
ferrite chokes around the power wires would be a very good idea.

Power Poles have nothing to do with isolation or stray RF. They are
simply very good connectors.

I am looking for a freqency synthesizer in the band 100Mhz-1Ghz very
stable to test quipments over a long period.

I heard that now there are some who are GPS disciplined?
How does it work ?
Which is one do you recommend ?

Phil.

A better place to ask the question is on one of the ten tec lists, e.g.
tentec at contesting.com
or tentec at yahoogroups.com.

Sounds to me as if you are not truly switching to transmit. Are you in PTT
or VOX?
Are you on CW or SSB?

If worse comes to worse, TenTec Service is hard to beat, and unlike some
other companies,
if they still have the parts, they will service your rig.

I would look for a standard synthesizer with a separate input for the
time base like many frequency counters have. Then buy a used GPS time
standard receiver with a 10 mhz output to drive the synthesizer.
Would probably be a lot less money than a current, state-of-the-art
synthesizer with it built-in. The HP Z3801A GPS time standard
receiver can be obtained on Ebay for around $300.

Dick

Before you get too far into spending money, you have to decide what stability and sidebands/phase noise you can deal with. Also, if you need traceability you have to start with that in your spec.

You can easily sink $500K into a fancy new synthesizer and end up with something that's not good enough for a lot of truly stringent applications.

Alternatively a surplus Z3801A (a few hundred $) + a surplus HP synth (a few hundred $ more) chained to the Z3801A's 10MHz out might do what you need.

The GPS lock gets you to the part per billion in precision. If the few PPM level is good enough you might not need GPS, the OCXO or TCXO that are typically built into the synths of the 80's and 90's may be good enough with a little calibration check-up.

Tim.

It works great mounted on a 4' chain link fence. Radials are already there
depending on the length of the fence.

I think that you are always going to find something that you do not like from a rig, but because of that i can't say that it is a bad rig. When we talk about of the FT-1000MP MRK V we are talking about one of the few HF rigs that really work. Just look into the biggest DXers, Most Wanted and DX Peditions, and see what they are using. When you add the R.FILTERS to the MRK V the selectivity is great and when the band is crowded on contest weekends you would appreciate having a MRK V fully loaded. Sometimes you need to go into a bad situation of crowded bands and other details that affect communication to see what this piece of equipment is able to do. In good band conditions these features sometime becomes useless and unnoticeable based there is no need to apply them.

903. New program CONNECT

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-03 02:08:20 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <du88ekkdf1@nwrdmz02.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 10889

There have been recent discussions about the interchangeability of coaxial plugs and sockets, their dimensions and their impedances. But, as usual, the magnitude of the electrical effects is never mentioned. Without numbers nobody knows what they are talking about.

A coaxial connector is a very short length of transmission line but at UHF and microwave frequencies it is an appreciable fraction of a wavelength. When 1/4-wavelength long it has the property of transforming a mismatched termination to another value. When 1/2-wavelength long the input impedance repeats the value of the termination. The SWR on an adjacent line is a function of the input impedance.

What is the effect of using a 75-ohm coaxial connector in a 50-ohm system?

What is the effect of using a length of transmission line of 50-ohms nominal impedance when it is actually 53 ohms?

With mixed values of line Zo at what high frequency does the SWR and reflection loss become excessive?

Program CONNECT.exe calculates the effect of inserting a length of line in a system of different Zo. Differences can be large or small. Line length can be physically very short.

For a given frequency, mismatched Zo's and a velocity factor, input impedance, SWR, reflection coefficient and reflection loss are calculated. (Reflection loss is sometime known as mismatch loss).

The program is worded in terms of a connector mismatch but has other applications.

Input data can be varied in small increments from the keyboard while observing the effects on calculated values. Download CONNECT from website below. It has entertainment, educationaal and practical value. Amuse yourselves!

In doing some research for someone on the Amderson PowerPole site, I
came across their claim that with proper crimping, the contact
resistance is less than the resistance of the wires connected
thereby.

Note the phrase "proper crimping". The vast majority of my
intermittents, improper contact seating, and similar problems with
PPs was due to "mickey-mouse" crimps made before I got the proper
tools (ratchet crimper from West Mountain Radio). One trip through
the ratchet crimper solved most if not all of those problems.

I was wondering if anyone knew of any fairly current 2m or 2/440 rigs
that allow programming access to the memories via means OTHER THAN
'cloaning' method?

for example here are a few that i already know of
tm700 tmv7

i am not sure about the most current rigs seems the web sites of the
manuf don't really say

any help is appreciated

thanks for the responce and not to sound rude, but i am very aware of
that fact, from the below,

however what i am looking for is a specific method of programming,
communicating to the radio via means other than cloaning mode commands
i need to find out witch rig's 2/440 have that specifically as an
option

the software i need to use, is not comptable w/rigs that program via
cloan"" mode

if anyone knows i'd really appreciate the help i know some rigs do it
only found the 2 below

tnx

I would think that most modern rigs would allow that. All of my
radios do. I have a Kenwood TH-F6A, TH-D7A, TM-D700A and Icom IC-746.
All are programmable by computer without cloning from another radio.
I wouldn't own a radio today that didn't have that capability.

I guess you are going to have to tell us what kind of programming you
are talking about. When you "clone" memories, you hook two similar
radios together by cable and transfer the data from one to the other.
We are talking about using a computer to transfer the memories, which
has nothing to do with cloning per se. My TM-D700, which I assume is
what you mean by TM-700, is no different from any other radio that is
programmed by computer.

do you have some pics? I "think" I may have some but it's been so long since I stripped them down I can't recall. I ask for the pics because as you know - one person's idea of antenna binding posts may be a tad different than others - for example. I want to get you the "exact" parts if I have them. I had a couple complete set ups at one time which I stripped down. I've since sold most of the coil forms and some miscellaneous. But I THINK I still have some other stuff in my junk boxes. I just need to match them to your needs.

Wellllll, from programming my several radios, most of the software used, does in fact emulate the cloning of radios, but with a computer on one end...I think, he is asking for real time control of the radio so the computer takes over the radio, like on some of the "scanner" programs out there written for the "black box" scanners, or the "high end" scanners..

I have a brand new Heil RP780, it was designed
for the IC-7800 and also the IC-pro pro11 pro111
radios. This mic new cost $269.95.
Has Cord for Icom and Hand PTT and also Stand.

If interested, please leave Email.
It's 2 days old. Used once for 5 min.

Sold the radio so have to sell the mic.

The Kenwood ts-2000 has commands which allow the reading and writing
of specific memories, direct VFO tuning, and so forth.

It's sorta expensive if used only as a 2m/70cm rig, though.

>I wouldn't own a radio today that didn't have that capability.

Although it's possible to program the memories on many radios using computer software (and, I agree, it's almost essential in these days of multiple-hundred-memory radios), the actual _protocol_ used in the programming of most radios tends to be cloning-based. That is, in order to update the programming of the radio, you first upload its entire nonvolatile-memory bank, then update specific portions of it using PC software, and then download the updated NVRAM image to the radio.

To the radio, this process looks like a "clone another radio" followed by a "be cloned" operation. It's relatively slow (takes a minute or two, plus image-editing time) and is disruptive of the radio's normal operation.

What I believe that the original poster wants, is a radio which allows selective memory updating, direct tuning commands, and so forth, via software control.

I'd suggest checking out the Linux/Unix "hamlib" package, which has drivers for many of the radios which have such capabilities.

greatful for everyone's trying to help out

ok i was told i am using the correct terminology however it's kinda obscure so not many know about it

and i am not smart enough to describe it better i'll take another stab

when a radio's memory is addressed for programming by a pc, it's typically done what is know as 'clone mode' an example of this would be any yaesu 2m radio(best as i know)

contrasted to the tm-700's method of programming via it's programming port to pc

yeah all radios have software that might accomplish the same thing but do so via different metods of addressing or accessing the memory

i know of a software developer that writes fantastic software for the apple he can only modify drivers to work with his program for radio's that can be programmed via means other than clone mode

unf there is not alot of ham software outthere for mac's and only one that allows radio memory programming for 2m/440 etc

sooo

the current software has drivers for rigs that are now almost disco, or kinda a bit expensive tm700 a litte much for me iwas hoping say to get a tm271 or simular but looking thru the manuals/broshures of some newer rigs and it dosn't say a thing about it's memory access

if i find such a radio he'll write the drivers for me

hoping that sombody might be able to point me in the right direction

930. cushman ce 4b service monitor and 314 mixer

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-05 02:10:59 UTC
From: "tucker@conninc.com" <tucker@conninc.com>
Message-ID: <1141524659.763325.164490@j33g2000cwa.googlegroups.com>
Source record: 10816

i purchased a ce 4b with 314 broadband mixer thru the internet, i
plan on using it to tune up
my ham rigs but i cant figure out how the monitor part of the cushman
works. I know it has a
314 high sensitivity 20-1000mhz mixer module, does this module allow
the monitor to receive a signal? If so should there be noise all the
time or is there a automatic squelch ?
Also i didnt get a operators manual so any basic operating tips would
be a big help. The ce 4
only recieves very strong signals and stays squelched otherwise, im not
sure if this is normal
or does something need repair.

I'm still confused. Programmable radios use serial data with
different types of ports on the radios. The TM-D700A happens to have
a standard 9-pin serial port, but I see nothing in the manual about
accessing anything in the memory.

934. Radio tracking a tortoise - HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-05 11:20:29 UTC
From: Floatything <chrisknibbs@sinkthespamntlworld.com>
Message-ID: <1QzOf.27369$Ru5.15888@newsfe6-gui.ntli.net>
Source record: 10820

Every year, Shelly the tortoise gets lost or manages to escape the garden.
It can take days to find her. I would like to build a locating device so
that I can track her down.
The basic requirements are:

a) that the 'transmitter (transponder?) on the tortoise is as small as
possible.

b) that it can be made by an electronics numpty. I have basic soldering
skills, and can eventually work out a circuit diagram.

Can anyone point me in the right direction?

TIA

You might be interested in this kit from Ten Tec:
http://radio.tentec.com/kits/Accessory it is #1059 which radiates on
the FM broadcast band (88-108 mHz).

So far you have not prevented me from purchasing amps on eBay. I wouldn't go around bragging that your vigilant either, unless this is what people on foodstamps consider vigilance. I'm sure I accomplish more positive goals in one day than you do in a month.

Thanks - that's excellent Howard - it looks just the job. So all I need to
know now are the 'basics of direction finding'.. I presume I need to wave
the aerial about a bit until I get a stronger beep beep? (tell me I'm on the
right track? or is there some magic method to homing in on a beeping
reptile?

The basics are a directional antenna and triangulation.
Do they still sell those RDF things for watercraft which
use a loop antenna? Same principle. A directional FM
antenna (like a yagi) which you can rotate to find the
strongest signal. Then move a distance and plot the
max signal as another line on the map. Assuming your
tortise isn't moving that fast, go the the "X" on the map
and retrieve your reptile.

There are lots of miniature FM transmitter kits available,
but beware that the range of many (most?) of those
devices may be limited to a range where you could
just locate your creature by sight (particularly those
which can be powered by photo-voltaic cells :-)

Note that you could also use preassembled GPS and
cell-phone modules (like those available from one of
my favorite toy-shops: www.sparkfun.com) and create
a box which you can call on your phone and will report
the tortise's current location. You could have the first
tortise-lojack on the planet! :-)

It is rumored that many high-value items (besides autos)
have this kind of secret locator transponder devices
installed in them.

I forgot to mention, you can buy just the transmitter and construct your
own receiver. The transmitter is FCC certified and I was able to look up
the specs on the www.fcc.goc website under OET equipment certification.

But can the Keydown Masters still get amps in the real world? Answer
Yes!!! I can get them any time I want and to make it even worse for
the anti keydowners... I sell them as well. I have been selling them
and buying them way before ebay or the internet and I will even after
they are gone... Now what anti keydowners???

<snip repeating message>

Posting the same message repeatedly to the same newsgroup is far
more likely to get you ignored than it is to gain you customers.

You may wish to take note of this quote from one of the Usenet
user's guides.

-=-=-=-=-=-=-=-=-=-=-

"How to advertise on Usenet

There *are* acceptable ways to advertise in Usenet newsgroups.

1. The on-topic notice

If you have a product or a message that is specifically related to a
particular Usenet newsgroup, and you want to let people know about it,
it's *usually* all right to post *one* notice about it..."

-=-=-=-=-=-=-=-=-=-

ONE notice. Not two, not three, not many. One. Would you advertise
this item, or any other, multiple times on the same swap 'net on the
same day?

I would hope not. The same principle applies to Usenet. You can
find more details on dos and donts at this link:

http://www.faqs.org/faqs/usenet/advertising/how-to/part1/

The only problem I see with this is that you will have to change the
battery on the tortoise pretty regularly. If you have just the receiver
on the tortoise and only go into a 'wake-up' condition upon receipt of a
signal from your transmitter you will get extended life. If the receiver
then triggers a beeper that you listen for you'll get good life out of a
battery and run less risk of the battery being flat just when you want
to go find the beast. Since the roaming range is fairly limited the
audible range shouldn't pose a problem.

Cheers.

Ken

OK. I'll just keep my TS-250, 2 TS-667V's, a Super Star 250
and some off brand "225" with 2 455's in it.

And an RCI 2950 that covers 26 to 32 MHz.

My current collection includes, 13 CB's,
2 IC-2100's that will transmit 136 to 174,
an HTX-420 dual band HT that covers 420 to
470 and 3 FRS radios.

> slapnutz.

Run out of intelligent things to say?
Oh, that's right, you never had any in the first place!

Even less when the Uncle gets off his duff and comes to terms
with WRC-03 and the rest of the world, ie, no code.

The only reason the Uncle is dragging his feet, is because it
won't make them any money to line his pockets, like forcing
DTV down our throats so they can auction off all that space and
filling the landfills with perfectly good TVs. Dumb, real dumb.

No problem, you're quite welcome. Just hope you understood, I have "forgotten" what those parts looked like exactly, so I wanted to be able to match them. While most "antenna posts" may look the same - a dial glass won't. At any rate, glad to hear you got your supply. As to these parts, many times I strip things down and sell the parts dirt cheap. I don't look to get rich off any one part - I "try" to offer a decent price for folks like you to do what we do. Hey, I scrounge too for parts to do projects! If I don't have it - I have to go look too. I love homebrewing myself and doing Tube type Ham and CB rigs (leisure and repair).

Hi all,

I found a manual on Tom Gootee's web site:
http://www.fullnet.com/u/tomg/gooteesu.htm, oredered it and paid for it via PayPal. Now, almost three months later, I still have not received the manual nor have any of my numerous e-mails, voice mails, or messages left with someone who occasionally answers his phone been returned. Does anyone know how to get ahold of him or what may be going on?

Thanks,
Stan

978. Mobile mounts

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-07 22:43:54 UTC
From: David Shrader <W1MCE@comcast.net>
Message-ID: <440E0CAA.2090406@comcast.net>
Source record: 10763

I have been using the Diamond K400C mounted on the lip of the bed in my Ford Ranger with Hamsticks successfully for four years.

I'm planning on moving up to a heavier antenna system, 500 watts on 60 meters [50 watts ERP], and am looking for manufacturers of sturdier mounts short of welding a support to the vehicle frame.

Who has comments? Pls provide URLs either direct response or on list.

How do I get an HP 8568 spectrum analyzer to reply to an HPIB command in VB4? What command do I use? I am using an NI GPIB/TNT card.

If you have an NI card, you are allowed to download the full suite of
NI VISA & GPIB software and run Measurement & Automation Explorer. You
should be able to type commands to the instrument and see responses.
Don't know if the 8568 will respond to a standard *IDN? query, but
that's one thing to try.

Like Ken said make sure you are sending a newline \n, ascii 10 or hex
0a or control J at the end of your command or query. You also have to
configure your computer to use 0x0a as the terminating character on
receives otherwise it will keep waiting for characters until you hit
the timeout.

I use VB6 with the visa32 library for GPIB, and key points are the same
as for using the manual window in measurment & automation. The visa32
documentation has an example that worked well for me.

This assumes your cable and adapter are good and that you have set a
valid address on the analyzer.

I was thinking more along the lines of inexpensive, entry level equipment...
the ranks of licensed operators is rapidly dwindling as all of us old farts
are dying off. The only time that there seems to be any push to increase
ranks is after a disaster, when the infrastructure is wiped out and all that
is left are the HAM radio operators. I believe that a lot of prospective
HAMs are put off because of 2 things....
1) The expen$e of buying new equipment, antennas, towers, etc. Most
prospects don't know that you gan get a workable station on the air for just
a couple of hundred dollars. All they *see* are the tower systems, and high
dollar radios where the HAM has been licensed for 20+ years and has
built/accumulated a top drawer station over the years.
2) The equipment is getting to where you have to be an EE just to figure out
what everything does. Newbies need to have a simple to operate station so
they can learn the basics, then after they get a handle on it, they can
start building a station with some of the latest and greatest, state of the
art, toys.
I don't know about you, but my first station was nothing more than a used
TS-520S, and a wire antenna(40/15M dipole), a borrowed MFJ antenna tuner,
and a straight key(no voice privileges for novices then)...That was all I
could afford at the time, and that almost broke the bank. I was a little
overwhelmed with the 520 when I first got it and it took me a while to
really feel comfortable with the rig. Imagine the new HAM today with
something like a TS-2000.....if they can afford it. Even tho I have been an
active HAM since 1984, I have had my TS-480HX since July, and I *still*
don't know and haven't figured out all it will do...and thats running it
mobile!! No tellin what it would do in the shack. Would I recommend the 480
for a newbie?? not hardly... but for an experienced HAM, its a great rig
that will do everything you ever dreamed of.

There still needs to be an inexpensive, easy to operate, entry level, HF rig, made available to the new Novice.

What kinds of rigs/stations did the rest of you *start* with??
What do you think that *most* young prospective HAMs would be able to handle to get into the hobby??

A Heathkit AT-1, 15 watts, crystal controlled on 80/40/20/10, used on 80
and 40 CW Novice band in the early 1950s. Receiver was a National SW-54.
Antenna was 120 feet of TV twin lead using a small home made tuner [made
by my Elmer]. [Total cost $65].

On my first weekend I earned the WATV award :-)

On my second weekend I earned the MLL Award :-)

On the third weekend I earned the OTA award.

On the fourth weekend my Elmer responded to my awards with corrective
action.

Praise the Lord for Elmer [Ralph Tedford, [W1GID ?] SK]

Subsequently, been on the air for 50+ years.

The problem is the competition. You can buy a NEW computer for $200, hook it up to broadband and be able to talk around the world, download video in almost real time, get the news, sports and things that you will never see or hear on the radio. No tests, NO MORSE CODE, no controls.

The days of electronics experiemnters going to the "radio shop" and buying some wire, tubes and spare parts and hearing people from around the world are long gone. The mystery is gone, the parts stores are gone and it seems that the desire to work to get an education is all lost in the rush.

Cheap rigs are simply not going to do it. There are so many used rigs on the market these days that go for $300-$400 that even mainland China with their factories that pay so little can compete. As for new rigs, everyone wants a simple voice rig with a digital VFO, a gazillion memories and an AUTOMATIC antenna tuner. You might as well not even include CW, most prospective hams can't be bothered to learn it.

Education and outreach is the only thing that will. Apple computer started the concept of "product evangelism", preaching how good the Macintosh was to the "great uncomputered". Their head evangelist, Guy Kawasaki wrote several books on the subject.

If ham radio is to continue, you need to "product evangelize" ham radio. Go out and give demos to schools, scout troups, youth groups. If there are any kids in your family or neighbors that are interested in computers, take them to hamfests, they'll go for the computers, but the radios may catch their interest.

It's also about time to change the license tests. Drop morse code. Add more good operating practice.

Here in Israel I hear mostly European hams. They are polite and careful operators. When the "skip rolls in" to use a term from another service, it seems like CB. Gone are the polite carefull guys, the U.S. phone bands sound like "lid city". And the CW is not much better, most of it is sent by computer and the same old garbage you hear on SSB, sent by people who can type and have a computer program to copy Morse.

Another pet peeve of mine is sstv. It was "neat" seeing it live from the Mercury space capsules. Fourty years later it has no technological relevance. Why do we have to give up 20-30kHz of the 20 meter band 24/7 for it?

Geoff.

With the advent of microprocessor based Ham rigs- many more features and wide band (HF, 6M, 2M, 440 and SWL) coverage is easily obtainable at about the same price as a new TS-130S (about $700 new 1980's). See ICOM 706 Mark II G. The "G" is an all-mode transceiver provides 100 watts on HF and 6 meters and 50 watts on 2 meters plus 20 watts on 440 MHz. It receives from 30 kHz to 199 MHz and from 400 to 470 MHz. For $899

In the 1980's you would have paid twice that for separate radios to cover those bands all mode

Lots bang for the buck

As far as complexity -- most have a menu presets -- choose your options and will operate much the same way as a TS-130S

CL -- I doubt, therefore I might be !

Leanne, TU, I'm looking at them.

I used a stake hole mount a long time ago with fair results.

I may have had installation issues. I'll take another look.

Yet at anytime of the day or night I am able to buy export radios and amps
as large as my car. You are fighting a lost cause. I'm sure you think it is
a noble fight, but again you are wrong. You simply fight this fight as you
have nothing of REAL value to fight for. Some days I almost feel pity for
you and your kind as you will never find true inner happiness as we that own
the aforesaid equipment will always control your life, your feelings Your
emotions show with ever desperate post.

You completely missed the point..... A *simple to operate* 100 watt HF rig,
NOT microprocessor based, HAM BANDS ONLY...
What was $700 over 25 years ago, should be able to be produced today for
just a hundred bucks or so. When the latest electronic toys come out, they
command a premium price, and after a couple of years, the price goes down to
where a working stiff can afford them.

Frankly, I'd be astonished if anyone could build a radio to those specific design goals (non-microprocessor-based, ham-band, 100 watt, roughly $100 retail price). I don't think that the combination of technologies, market size, and price can be achieved. It'd be a very interesting challenge to design, to say the very least!

That's not to say that somebody shouldn't try.

My reasoning is roughly as follows:

- Ham-band operation requires stable frequency operation and tunability. This either requires a very stable VCO, or a synthesizer/PLL system of some sort.

- Mass-production consumer electronics, most commercial comms electronics, and military electronics have long been moving away from the classic sorts of finely-tuned-and-temperature-compensated analog oscillators used in a lot of the sort of classic ham gear you're referring to. These days, decent air-variable capacitors with good bearings are either special-production builds (and horribly expensive) or are used or "new old stock" surplus and thus not suitable for mass commercial use. The same thing seems to be true for a lot of the other "classic ham" electronic components... they're being end-of-lifed and we're lucky to be able to stock up our junk drawers before they're entirely gone!

- Today's low-cost radios are almost all based on synthesizer technology of some sort, with a microcontroller driving the synthesizer. I wouldn't want to try driving/commanding a synthesizer of this sort without a micro - they aren't set up for it.

- Multiple-HF-band operation requires band-specific low-pass filters... certainly after the amp, and perhaps before. You could probably get away with a filter system using less filters than bands (e.g. one filter for 10/12/15, one for 17/20, etc.) but you're still going to need some LPF switching and some fairly hefty inductors.

- Restricting to ham-band-only probably doesn't buy you all that much in savings or performance, these days, due to the large number of bands. In order to gain big savings, I suspect you'd have to limit yourself to a monoband radio.

Now, the idea of doing a simple-to-operate, straightforward HF rig with decent performance isn't a bad one at all. I do suspect that in order to make it manufacturable at a reasonable price you're going to have to accept _some_ degree of LSI integration and microprocessor control. That doesn't mean that it needs to have a massive set of features, lots of bells and whistles and gawldernblinkinlights, etc. It could be a nice, clean front panel.

The closest I currently see to what you're looking for is probably the Ten-Tec Argonaut. However, it's not a full-power barefoot rig... 20 watts... and it's at least five time your cost goal.

I won't say it's impossible to get the retail price of a 100-watt multiband ham-HF rig down to under $200. However, I suspect that it'd require a very great deal of optimization and integration, a lot of use of modern technology (i.e. spinoffs from today's commercially-available RF and DSP chips), and a development effort which would require a potential marketplace of hundreds of thousands of units (or perhaps millions) sold in order to justify.

It'd be interesting to see sorts of HF rigs might be build around a modulator based on some of today's cellphone chip cores and IP... direct conversion, high-performance I/Q phasing modulators, and so forth. More work up front, but (potentially) a lot lower per-unit incremental cost once you get into volume production.

Unfortunately, I'm not sure that the size of the market would justify the investment, needed to create the sort of radio which you feel could help maintain and increase the size of the amateur-radio market in the way that you'd like :-(

Don't think I missed the point at all
Labor rates UP
Factory space cost UP
Parts UP
Advertising cost Up
Taxes UP
Convention Rates, Travel, Hotels, UP

And at an inflation rate of 4% per year -- the $700 1986 radio would be
$1533 today (sound familiar)

I doubt any mfg can produce your $100 radio (with a 40% margin u wud have to
build it for $60 !!!)
Maybe in China Huh ?

Even the Elecraft basic radio -- (u build it) is $359
And it is CW only -- 4 bands 40, 30, 20 and 17 or 15M
But they are selling a lot of them - folks still love to build

--
CL -- I doubt, therefore I might be !

Restricting to ham bands only buys a HUGE difference
in performance. Check out the Elecraft K2 and see
what kind of strong signal handling performance you
can get from an inexpensive radio if you have single
conversion right to the high-selectivity crystal
filter.

Third order IMD performance at 2 kHz is more than 10 dB
better than many of the expensive radios with general
coverage receivers, such as the FT-1000D and FT-1000MP
series, and is approximately equal to the 10 kilobuck
IC-7800! All because of the ham-band-only design and
some careful attention to design.

73,
Bob

You're quite right, of course. I overstated my argument.

I think it's probably fair to say, though, that the sort of advantages that the K2 family (and similar radios) gain in performance by eschewing general coverage, might be very difficult or impossible to achieve at the price-point that the original poster was hoping for. A lot of the K2's improved IMD performance appears to come from having band-specific double-tuned bandpass filters in the front end, switched in via relays. This seems to be a technically excellent approach, but I can't believe that it "comes cheap". Reed relays seem to run a dollar or more each, in large quantities.

PIN diode switching of bandpass filters is another possible approach, but I don't think you'd get the same sort of performance out of it.

At a sub-$200 retail price (which probably works out to under $50 bill-of-materials cost) the designer is going to have to make some pretty hard decisions about where the money is to be spent. The additional performance available from a band-optimized design (e.g. the K2) might not be "in the budget" at the lower price point.

Consider that the K2 is between three and six times the price that the OP was looking for... and it's a kit, has only 15 watts of output,

doesn't include a power supply, and I don't think it includes a microphone either.

There would be some very, very interesting tradeoffs and design decisions to be made, in any project to develop a sub-$200 mass-market-acceptable SSB HF rig. Possibilities:

- Run the finals on 24 volts, so that acceptably-linear operation could be achieved from cheap power MOSFET parts?

- Use some of the new hybrid FPGA/DSP/microcontroller chips, to put all of the control logic, audio filtering, etc. on a single chip?

- Limited duty cycle, to reduce the need for heavy/expensive heatsinks and fan cooling?

Even if its sub-$500, that would still be a blessing for a young ham thats trying to raise a family. e-bay is ok if you don't mind taking the chance that the radio will be DOA when you get it, and not all clubs have the resources to be able to set up a new ham with a "loaner rig" to get them on the air. Something basic that will get them on the air without breaking the bank would go a long way in being able to promote the hobby with young people.

Well few of us start off with a new car
So for the dollar impaired how about
TS-520 - $180 with shipping has power supply
E-Bay completed

Another TS-520 with MC-50 mic -- $275
E-Bay Buy It now

Lots of old rigs for under $500

I think the things that holds up youth from becoming Hams or getting on HF
is really
1. The code (weak excuse)
2, The internet (talk anywhere)
3. The magic of radio was 20 - 30+ years ago - not today
4. The test as compared to CB, FRS

"I feel your pain." Seriously, you have a great point. I am now
studying to re-acquire my General license (I'm 50). Yes, things have
changed quite a bit since my days with a reasonably priced HW-101.

But, I think QRP is where some neat high quality stuff is available,
especially in kit form. It's also a great way to start into ham radio.

Regarding CW as a barrier to many new hams, I don't know. The "old
school" approach is part of what I like about amateur radio. Nostalgia

is not worthless. I hope we don't lose CW.

Nostalgia is attractive in other areas. Audiophiles have returned to tube amps for many years now. Some of the units are set up so the owner can enjoy the tubes' cool purple-blue glow varying with the music. Baseball is largely nostalgic. I'm sure there are other examples.

I guess my point is that amateur radio shouldn't try to compete with internet, or whatever. It has a sort of historical niche...it can be pretty cutting edge and nostalgic at the same time.

I would recommend QRP as the best entry into ham radio.

john

In 1980 the HW-101 sold, in kit form, for $399.95 in the fall 1980 Heathkit catalog, with the optional CW filter adding another $44.95.

See URL: http://www.elinkusa.com/hw-101/HISTORY.htm

Using an inflation rate of 3.5 %; $400 in 1980 is $978 today -- the cost of a IC 706 MK 2
And the ICOM is Factory assembled, all mode, and covers HF and 6 meters (100Watts) and 50 watts on 2 meters plus 20 watts on 440 MHz. It receives from 30 kHz to 199 MHz and from 400 to 470 MHz.

Golly John straining the old brain cells.

First rig was a used (15 year old) Hallicrafters SR-160 - paid $100 for it
in 1977 when I first got licensed
Needed repair and new finals. Power supply needed recapped.

But my very first "rig" was a homebrew crystal set - 1947 (Oatmeal Box and
all (;-))
Then a Knight kit OceanHopper - 1948
Next was a Hallicrafters S-40B
Then a Halli S-38
And the US Navy let me use (;-) an ART-13 and ARR-15 (Collins Gear) to send
and receive Morse code on Pacific flights
Next was a Knight R-100

Heathkits I built were a Heath Linear SB-230, SA-2060A Antenna Tuner, Heath
Color TV set (took months to build), as well as the usual VTVM,
Oscilloscope, Signal generator, etc

Should have kept them all (;-)

ml,

Let me try to clarify this whole thing and perhaps give you the correct terminology to be better understand and to better explain what you are asking..

First, whether it is done in what you call a "clone mode" or "by computer", the radio still has the capability to fill memories via an external (data or computer) port. If the software writer can find, or figure out the protocol, he can write what you call a driver to get data into the radio's memories. You just hook up a computer to the two radio's data connection when they are "cloning", and look at how the data is sent and duplicate that protocol in your computer program (driver).

Many radios that have external programming capabilities, have the protocol either published or hacked by hams (I've done some), so it is on the web somewhere.

Second, some radios also have the capability of being controlled in a real-time mode. This is called "CAT", but I don't know what it stands for. That is, they can be operated fully by the external port. I'll call this the computer control port. Icom calls their most recent version system "CI-V".
These radios also usually have memories and also allow loading these memories (and reading them) through the computer port.

The TMD700 has all this capability, and, yes it is a bit steep at $500, but is receives from 118 to 1300 MHz and has a TNC and the APRS software. I got mine used. Unfortunately, I do not have a list of computer controllable, dual band (2M & 440) radios. The Kenwood tri-band (2M 220, 440) hand held is such a radio. There are only 1-2 things you can't do from the computer port.
The 706 family has *SOME* of these capabilities and does include loading memories with frequency and much real-time control.

I'd try searching on something like: +"Computer control" CAT +"dual band" ham +"amateur radio" and see what you get. I did a quick look, but there was lots of noise in the hits (not much good stuff).

I suspect you want to ask is something like this:

"What dual band radios have memory loading capability via computer?"

"What dual band radios have CAT control?" Or "What dual bander has computer memory loading?"

FS: Kenwood TS-830S HF Transciever
Looks and works VERY nice!! the small little button for the noise
blanker is missing. But this transciever as stated looks REAL NICE.
Rated 9 Plus.
Frequency read out.
Comes with the original Box and service manual.
No microphone.
Price: 345.00 for a great rig.
ritchi50@optonline.net

There's the Yaesu 840 and the Icom 718, about $600, and the starter
Alinco, forget it's model #, about $700. Even the yahoo-whistles Yeasu
857d is only $689 nowadays.

Maybe there's not enough demand for such a thing. Moreover, the
threshold gets raised for so many varieties of technogadget. If we take
a possible parallel from the world of computers, a 6MHz PC-AT clone with
1MB of RAM and a 20MB hd should now cost perhaps US$25 and might well
suit the computing needs of a lot of people (as long as they didn't
insist on trying to run any version of Windozzzze on it). But, as
somebody wrote a few years back, "The computer I want always costs
$2000": the bar keeps rising.

1036. Push up mast?

Newsgroup: rec.radio.amateur.equipment

Hi,

Radio Shack used to carry a 30' push up mast. It was segmented into 3 (4?) parts, with guy rings at the junctions. Much sturdier than the standard 1.25" masts commonly available. They were useful for small beams, but more so for supporting inverted Vs and dipoles. According to the local RS stores, they no longer carry them, and they don't seem to be available at the RS web page, though there is a "heavy duty" stackable section available. Anybody know of an equivalent mast today?

http://www.hobbytron.com/CK007.html is one such.

There are 'self-powered' circuits around for this which do not require
a battery, but I'd recommend avoiding them. Any circuit which draws
more than a very small amount of current from the phone line may
either take it off-hook accidentally, or trigger a wiring-fault
indication at the central office.

I got a pair of professional grade, heavy duty self locking extendable paint roller handles, they extend up to 24' and are heavy enough for a small beam or a larger vertical. I used some key rings to attach the top guys slipped over the top threads.

A better circuit - one that I've used as far back as 1980 for exactly that purpose - consists of a R/S 5 v reed relay in series with one leg of the phone line. "Standard" telephone line off-hook current is 30 mA, which will trip this relay and not degrade the "battery" voltage at the phone. Hook up a 12V "wall wart" and LED in series with the NO contacts and you're in business.

Mind you, this doesn't cut off the extension - it merely indicates that the line is in use. To cut off the extension there are other, more sophisticated (and expensive) devices.

Most of the circuits out there require a separate battery
to power the indicator because drawing enough current
from the telco loop to light the off-hook LED interferes
with the on/off hook detection.

Perhaps even better are those passive devices which
lockout other phones once the first one is picked up.
Like these (others, etc.)
http://www.glbproducts.com/catalog/set__of_two_telephone_modem_lockout_sentry_4737042.htm

I believe this can be done with a single diode (some kind
of breakdown device), but I can't remember which kind or
find the circuit just at the moment.

Source record: 10733

Hello all.

I have a National Panasonic RF-5000 (1972) I'm looking to sell, but would like to replace the telescoping mast antennas first. One is broken at the top and the other is somewhat bent.

Does anyone know of a source for these, or possibly a RF-5000 for parts?

The radio is in otherwise excellent condition, but I think replacing the antennas would increase it's value.

Thanks in advance,
Phal

Ref my original msg. Yes my old corded phone had the indicator
built in, but it went on the blink so had to buy a new one
from wal-mart. Shuucks I'll just run a powered LED fed from
the basement where the computer room is, and plug an ac adapter
into the master switch so if I turn on my computer a flashing
led will be on the wall upstairs and it wont even involve the
phone line (except to warn that I am down here hacking away
on the internet.)

Most "proper" phones can be connected in a "chain". The main phone, when off hook, automatically disconnects the later part of the "chained" phones.

Most modern modems have this function as well.

When the XYL lifts unhooks the phone, there would just be a dead line as long as the modem is online.

It's possible that the Taiwanese Wal-Mart brands doesn't include this option and if it is so, you can easily build a chain by adding a small relay that disconnects the other phones in the house as soon as the modem line consumes any current. Remember that the line impedance should be around 600 Ohms.

This is a simple piece of design, just place a small resistor in series with the modem, drive a small mosfet with the voltage drop over the resistor and trip a small relay. I don't know your line voltage in the US but I'd assume it's 48Volts, so a 48Volt modem should be dirt cheap as it's telephone standard. If you wanna do it a bit more fancy without the relay, use a pin diode to cut your dear lady off... It's even cheaper!

Cheers

Dan / M0DFI

The venerable Kenwood TH-F6A has 3 speaker mics as options (4, if you count the clip mic/w earplug). The least expensive mic (SMC-34) seems to have it all, remote & volume control. The SMC-33 has just the remote but no volume control. Remarkably, it costs twice the amount of the 34, that has the remote & volume control. Another Speaker mic, the SMC-32 has neither remote nor volume control and is almost as costly as the SMC-33.
I know I threw a bunch of letters & numbers at you, but in essence, what I'm alluding to is why does it appear that the remote mic with the least features, cost the most. Can this be another ill-advised Kenwood marketing ploy? Has anyone put a handle on this? I would like to buy a remote mic, but frankly I'm puzzled and the salesman hasn't the foggiest. Help someone ... anyone? Thanks kindly in advance.

Cordially,
west

Kenwood Ts-870s transceiver,
10 through 160 meters. Has built in tuner and Dsp, These radios are known for their great sounding audio. No Microphone, Comes with power cord and manual.
This radio works and looks GREAT!!!! I used it daily but changed all my gear to AM Boatanchors. :)
Price: Shipped and Insured 1035.00
I take paypal or postal money order.

West,
I noticed the same and cannot begin to fathom it myself. In my case I
went for the earbud/lapel mic because it suits my purposes best. For
another HT that I've used the Premier SPM102 (for Kenwood it's the
SPM101) and found it a tad larger than the average speaker mic however
it will handle high volume well and the sound quality is decent.
These run about $32 at AES - which ironically is within a couple
dollars of the price for the Kenwood SMC-34. It could be that the
volume sold of that model has been sufficient to write off development
and ammortize tooling costs so that's why it cost less.......guess
we'll never really know until someone from Kenwood steps up and
publically answers the question.

I guess that's the reason I bought the SMC-34. Of course I also
wanted the volume control. I looked at the brochures for all three,
and can't see any reason why. Only the Shadow knows.

Gidday All,
this Posting to advise I have several of these
fantastic High Power (35 Watts typical Output) Linear (All Mode)
Amplifiers available For Sale.

See my eBay Listing.. simply Search on "1296 Mhz"
These Amps can also be provided with a 1265 Mhz "tune" to suit ATV
frequencies !

Additional information can also be found on my Website as per below.

Questions : Email me direct. I will gladly provide more information.

Cheers & thank you.

Funny I should read this post tonight...I was just talking about my old ten meter handheld with my wife; sold it years ago and wish I still had it today. It was an AEA DX Handy. It operated both SSB and CW and offered about 50 Khz (if I remember correctly) coverage each in two places on the ten meter band. It used a couple of crystals swung the frequency about them a bit. It put out 1 1/2 watts of RF. I worked my first HF contact with one of these....Cincinnati to Salt Lake City (but cheated and was feeding the RF into a low dipole). My favorite contact was operating the rig "stock"...built in telescoping antenna, trailling a counterpoise behind me. I was stand in the parking lot of a local grocery store and worked and East German station on the day the wall came down. Unforgettable experience! These radios are kinda rare now, although they were also marketed in Japan under another name (Mizuno?) The Japanese company was the actual manufacturer of the radio. There was also a version made for 6 meters.

The Icom IC718 can be bought new from AES for $549. It's a pretty basic
radio with not very many buttons. The Alinco DX77T is about $150.00 more.

Bingo! If I want a basic radio, I can go to a flea market and pick up some nice simple stuff. When I buy a new radio, I want features and good ergonomics to go along with them. That is what the market has turned into.

At Dayton last year, I picked up a 80 and 40 meter version of the Single Sidebanders for 20 bucks for one, and 25 for the other. Both worked fine. Just about any kid would have the money for that. Wasn't State of the art, but 200 watts on SSB, and a cheap wire antenna can get a person on the air CHEAP!

Now that is sad, a Yahoo group for junk.

I've got a JT308, paid 30quid for it, wished i'd paid a bit more for a real
used 70cm HH

It's ergonomics are the worst i've ever used,
and it's chin/lish manual needs an interpreter

But OK for a cheap PMR set which only needs setting up channel and tones
once

What more needs to be said

Steve Terry

Does anyone have a source for a PDF of the ICOM IC-229H transceiver schematic? The ICOM site no longer has this on ther site and I can't find my maintenance manual (if I ever had one).

What I need to know is if there is a bias resistor feeding some positive voltage to the mike audio pin (pin 1) of the microphone connector.

A quick Google on IC-229 turned up

http://members.tripod.com/~Malzev/cb-funk/ic-229.htm

and there's a PDF scan of the schematic.

> What I need to know is if there is a bias resistor feeding some
> positive voltage to the mike audio pin (pin 1) of the microphone
> connector.

It looks so, based on the schematic cited above. From an 8-volt
supply there is a 100-ohm decoupling resistor, followed by some
electrolytic and other power-supply bypassing to ground. From this
bypassed supply voltage, a 1k resistor R7 is connected to the MIC
line. This same junction then goes through a DC-blocking cap C135 and
thence to the source of a JFET Q2.

So, I think you'll find roughly 8 volts DC sitting on pin 1, when
measured with reference to the microphone ground-return MICE on pin 7.
Short-circuit current to ground would be approx 8 mA.

THat's what I needed, Dave. I will be using the IC-229H microhone
with another radio (Elecraft K2) and I needed to make sure that a
bias resistor was needed,

Many thanks.

>The way I do it is as follows ;

Remove all switches, knobs, dials ect.
Then remove the front cover (sometimes you may need to remove locking nuts
ect to release the cover completely).
Then it's just a matter of cleaning every nook and cranny with a solution of
WARM water and washing-up liquid in a CLEAN plastic bowl.
Dry and set a side until all moisture has evaporated then re-assembly.
It's best not to use any other cleaning agents I find.
You may want to take a look at items that may require lubrication while you
have the front panel removed.
Hope this helps.....cheers, Ken, G4KIR.

1088. FS As New Mosley CL-33-M Beam

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-15 18:27:37 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <r0ZRf.249337$oG.100749@dukeread02>
Source record: 10674

I have a like new condition Mosley Classic 33 HF Beam for sale. It the late model CL-33-M and currently sells for $650 from Mosley. It has great gain on 20, 15, and 10 meters. It has a 18 foot boom.This one
was up for a little over a year and looks brand new. It has been taken down and is partially disassembled. It would be very easy to put it back together again since all pieces are color coded. It also would fit into a
pickup truck for transportation. The price is $300 picked up. I don't want to ship it. Or I can meet someone within 100 miles of Abilene, Texas.
Thanks, Charlie Hugg, K5MBX

Source record: 10676

I have a CDE Ham IV Rotator for sale. It is the older model with the black
and white metal Control Box, not the Black Plastic one.
The Rotator needs cleaning and lubed and a new control cable screw
plate installed. Otherwise it works and looks good. Price is $185.
Thanks, Charlie Hugg, K5MBX

I've got one, too, and it's terrific. The only thing I haven't figured
out is how to delete the contents of individual memories. I can do it
on my Yaesu base station, and it would be nice if I could do it for my
HT. Do you have any suggestions, others than completely resetting the
radio?

Thanks. I figured it might be something like that. I figure that if I
ever travel to an area where there are repeaters, I could program the
frequencies and settings for them ahead of time and then delete the
contents of those memories afterwards.

Sure.

Just take a pencil, and where it says "50 Mhz" on the front panel,
write in "27 Mhz". Everyone knows that all linear amplifiers work
equally well on all bands and that suggesting otherwise is just a
market ploy to get people to buy more boxes.

Don't forget to drive it with your "tweaked" Galaxy, Connex or
other "import" radio with the mic gain at 100%, fed with a
pre-amplified microphone. And remember to tune for >>>MAX<<< SWR,
>>>NOT<<< minimum.

And remember to use the international test calling signal:

"AWWWWWWWWWWW-DE-OOOOOOOOOOOOOOOH..."

"AWWWWWWWWWWW-DE-OOOOOOOOOOOOOOOH..."

You'll probably need to add inductance, maybe reduce capacitance in
any tuned circuits.

To lower frequency from 50MHz to 27MHz you need and / or bigger inductance
and bigger capacitance.
2 x pi x f = 1 / sqrt(L.C)

I would try to get by with the existing variable caps at the early stage until you have got the thing sort of working. There may be a small tuned input circuit or there may be a passive resistor. To start, I would double the number of turns in the tank circuit of the final and in the input coil (if any) and tune the variable caps to see if there is any output. I used to use a light bulb to coax fitting to look at how close I was getting to resonance. Remember there is a lot of voltage on the final so discharge the power supply caps through a 100 ohm or so resistor each time you fiddle. This amp may be grid-driven so keep the tests very short to avoid burning up the grids. There are ways of getting the coil/capacitor values correct without using the final voltage if you let any of the smoke leak out of the resistors.

Hell, I'd just keep adding turns until the dingus quits shutting down.
Sniff for parasitics, adds caps as necessary.

IF CBers had a bit of discipline, courtesy, and knew more, as a whole,
what they are doing, the noise could be decreased by
quite a bit! ?But NO! ?EVERYbody has to have an amp to talk 2 miles down the
road, or to
the next truck right in front of him. ?Before the 70s, I used to lay on my
bed with a BACK OF
SET Radio Shack antenna and a Raytheon 5-channel CB and talk in a 5-8 mile
radius. ?We had
a regular round table most every night. ?Everybody was courteous, took
turns, didn't use power,
and we had no trouble talking--even when that roaring skip was in we could
talk over it because
those people weren't using extra power, either. ?When the BIG AMPS came
along to replace self
confidence lost I-don't-know-where, you couldn't talk a mile away. ?Now,
more than ever, there
are operators who think THEY have to out-talk the rest in order to feel
powerful and replace the
"leaking" testosterone. ?Hey, I don't have a magic answer because you and I
both know that it
\won't stop without some serious enforcement. ?It still boils down,
nonetheless, to the fact that
those truckers have those 40 channels that they can use legally. ?The hams
have the 10 Meter
band via licensure. ?It STILL isn't the hams' fault that those channels are

screwed up, nor does
it justify stealing frequencies from the rightful users--whether they are
occupied or not.

I do have something of a solution, but nobody would like it. Put CB up on
FRS and MURS where
there is little occasion for skip, and the truckers wouldn't be bothered
with all that noise. Form
associations and use voluntary bandplans to separate users, so that interfer
ence would be kept to
a minimum. Yeah, we know that wouldn't be met with joy, don't we? We want
to work "DX",
play with BIG POWER, and complain about how we can't talk without our amp.
I don't mean to
be ugly, but that's what it amounts to. Really, you can't have it both
ways! That is truly what needs
to happen; because the general public is NOT radio savvy, VHF/UHF is where
CB needs to be to
prevent all those "turf" wars, skip, and racket. It WOULD make a
difference. Not likely to happen soon. Still, never say
never.....

It's called "SARCASM", you idiotic moron.

But thanks for proving my poiint about YOU yet one more time!

Steve, K4YZ

or just stick a rf generator in there and tune up your tank ckts with
no power applied maybe. two times turns should get you very close tho.

Wind a coil like the original, but add two additional windings. You
may also need to add a little parallel capacitance (100,300 or 300
uuf) to the load variable cap. Tune the input to 50 ohms. You may
have to compress or expand the coil a little.

Should work...

Win

FS: Ameritron AL-82 Amplifier
The 3-500ZG tubes were replaced
with new tubes
about three months ago.
Works GREAT!! Legal Limit.
Best offer, Please don't ask how much.
Just make offer. I really don't use it and
ready to sell.
ritchi50@optonline.net

which does not alter the fact you just lied

which you clai you never ever do

maening that is lie

you lie constantly

you rationalize it a joking or sarcasm but you just prove that you are
untruhful

Forget it, Scott...Morkie is drawing welfare for a "disability",
and any demonstration that he can do something to overcome his
"disability" means he'd have to come off welfare and get a real job.

He DOES claim an IQ of 248, though...Makes ya wonder what all that
"MENSA" silliness is about with intellects like Morkie, doesn't
it...?!?!

> brammage and igornance.

For those of you just getting to know "Mark Morgan, KB9RQZ" via
his spamming and cross-posting of RRAP and other "rec.radio" groups, a
little intro is due.

Mark started in here about 8 years ago with his functionally
illiterate diatribes, mostly trying to get support for his "waivers"
for Morse Code due to alleged neurological deficits, among which he
alledges being "dyslexic".

The problem is Morkie tried to get an allergist to write his
"waiver" for him. After having claimed an IQ of over 240, one has to
wonder on what two fingers he added that up on. It was suggested he
see a neurologist, but like every attempt to help him, he told those
who suggested it to get ####ed.

On finding out that I was an enlisted retiree from the USMC,
Morkie started in on tales of how >>>HE<<< was not only an officer, but
a COLONEL in the US Army "chemical corps", and that he was DRAFTED
ta-boot!...As if that meant a rat's pack of snot in this forum!

Of course Morkie didn't count on anyone actually being able to do
math better than he...You see, based upon his birthday (which was once
in QRZ), Morkie would have only been SEVEN years old when the drafted
ENDED in the United States...

Anyone seeing a pattern here?

When he was busted with this fact, he then relented and "admitted" that he was "only" a lieutenant, but that his unit CO wouldn't let him resign even though he's an admitted sexual deviate. Of course he's since changed even THAT story, and he now tells a tale of how he was an enlisted clerk in the Army, discharged for emotional problems.

Yeah...Right. A "clerk" who can't even SPELL "clerk"... ! ! ! !

Over the past several years, Morkie has alternatively denied being a mental health patient, then admitted that he's being treated for "anger issues". He's also lied about being in trouble with the law...You see, Markie likes to "care" for his elderly father by taking advantage of him, then skirting the law. It's been a close shave.

Now Morkie's moved from his previous QTH in south-central Illinois to the Michigan Upper Penninsula in order to (A) avoid the aforementioned abuse issues, and to (B) take advantage of more lenient welfare laws that allow him to pork out at home while allowing you and I to "earn" his income for him.

Among his many NG credits are his claims of being stalked, his admission (and only redeeming attribute) that he not only lies, but does so without moral reservation, and that he believes that children should be TAUGHT to lie.

Morkie now "claims" to be married, but can't seem to produce any evidence of it, other than to point to the recent licensure of a female-sounding named person who shares his POB in Chassell, Michigan.

Oh yeah...His "wife"...Allegedly a law clerk or paralegal of some sort, they were allegedly married in Israel. No doubt a green card scam if they are indeed "married". Obviously she doesn't care enough about him to take his name, even to have it hyphenated with hers.

So ...for those of you just tuning in, sit back and enjoy the flailings of Mark C. "I Am A Drafted Gay Pagen Chemical Corps Officer" Morgan.

He never disappoints!

stave that was a result of misreading my cliams and GiGo it was most
entertaining

>
> Over the past several years, Morkie has alternatively denied being
> a mental health patient, then admitted that he's being treated for
> "anger issues".
another lie

I never said I was being treated for anything anger issues or not
>He's also lied about being in trouble with the
> law..
where?

never been in trouble with law, except the occional speeding ticket

Now Steve did falsely alleg I was abusing my Old man, and it was
investagted and I was cleared
>.You see, Markie likes to "care" for his elderly father by taking
> advantage of him, then skirting the law. It's been a close shave.

hardly
>
> Now Morkie's moved from his previous QTH in south-central Illinois

Illiopis township includes the exact center of the state of Illinois by
some measure (by others a neighorring township does bu steve never lets
facts interfer in his lies)
> to the Michigan Upper Penninsula in order to (A) avoid the
> aforementioned abuse issues, and to
really? that is news to me
>(B) take advantage of more lenient
> welfare laws that allow him to pork out at home while allowing you and
> I to "earn" his income for him.

no wlefare income either

just steve string togther a series of lies
>
> Among his many NG credits are his claims of being stalked, his
> admission (and only redeeming attribute) that he not only lies, but
> does so without moral reservation, and that he believes that children
> should be TAUGHT to lie.

yes indeed I do belive that all person should lie in the right
circumstance

Steve reported me to child abuse authorities and they agreed ..with me
obviously
>
> Morkie now "claims" to be married, but can't seem to produce any
> evidence of it, other than to point to the recent licensure of a

> sort, they were allegedly married in Israel.
what is the problem with that?

are you antisemitic as well?
> No doubt a green card
> scam if they are indeed "married".
no doubt in your mind, but reality is different

she as well as myself are US citizens we choose to travelto Isreal for
our Marriage and Honeymoon
> Obviously she doesn't care enough
> about him to take his name, even to have it hyphenated with hers.

well I thank you one her behalf for once calling her a she rather than
a he

but we simply choose to live our lives as we see fit without consulting
the likes of Robeson

and indeed there we have the one "crime" I am guilty of, being
different something that Robeson can't stand for in even the slightest
degree... and I do far beyond the slightest degree I admit
>
> So ...for those of you just tuning in, sit back and enjoy the
> flailings of Mark C. "I Am A Drafted Gay Pagen Chemical Corps Officer"

he can't

he is so afraid of me that he must reatin the abilty to follow my every
word and denouce what he sees as my shortcomings (some real some just
the result of fevered imagination) to world

you see steve is afriad of bisexual people

science the most likely reason is that steve has problem with represed
bisexaul urges

so steve can't kill fill me, bt he can't tstlak my every word over the
net

he also likes to pretend he eye on the ground amoug the good citizens
up here in MI

when it pleases me sure but this is hardly the right place for that
discusion

you like steve think you have the right to control other people private
lives

or to stalk and black mail people with thing wether they are
emabrrasihed about themm or not

but you porve your are afraid of bisexaul folks steve just like steve

strange to you fine I agree
but why do you care?

why is a proper topic for RADIO NG's

I bet I get no real answer to that

Id be happy to never discuss the matter in radio gruop if children like
you and the other steve and Dave and few others wanted to talk about
.....
GASSP .....radio

but you still porve you are a zenophobe just like Robeson, threatened
by my mere existance plus the facts I am not ahomsed of my private
life. I do wish people had the good manners to leave it private but
that you and others are uncivilized barbarians is not my doing

Amps, whether certified or not will end up as they always do,,,,,,used on 11 meter and the freeband in addition to the hammie bands, regardless of what the FCC does or doesn't do.

Haven't had much luck on triple five lately,,,you been sandbaggin there lately? Most of my action has come from ssb recently. Send me an email and let me know next time you're working some dx near Dixie. Take it light and try to fly under the radar.

I have a brand new in the box Spi-Ro Trap Dipole Antenna, Model D-56
Professional Series. It sells new
for $152.95. Type Spi-Po Antenna into Google and it will take you to their
Webpage.
This antenna has 6 traps and is 82 feet long. It handle up to 600 watts. It
covers 10, 15, 20, 40, and 80 meters. I have the original instructions. It
has never been out of the box or plastic shipping bag.
Price is $92.95 and I will pay shipping in the lower 48. Thanks,
Charlie Hugg, K5MBX

Very entertaining... Sorry, I don't have the time to play.....my time is
just too valuable to waste on long running pissing contests.
I am just now getting home for lunch... still have a couple more $ervice
call$ to do after I go to the supply house.... booked up for tomorrow and
most of next week too.

1146. FS: Ameritron AL-82 Amplifier

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-17 23:01:22 UTC
From: ritchi50@optonline.net
Message-ID: <ttfm12pe6v6bajvavprdlpclu8v3f8kj6f@4ax.com>
Source record: 10632

FS: Ameritron AL-82 Amplifier
The 3-500ZG tubes were replaced
with new tubes
about three months ago.
Works GREAT!! Legal Limit.
Price: 1000.00 Plus shipping
I would drop it off at UPS store for them
to properly pack it, or you can pick it up in NJ
I have a picture if you send me an email.
ritchi50@optonline.net

1147. WTD: SIMPSON 464 TEST LEADS

Newsgroup: rec.radio.amateur.equipment

I picked up a Simpson 464 Series 3 DVM sans Test Leads. They are the
Reverse Banana Plug style.
Anyone know where I can find a set ?
Google is no help.

Thanks, Dick, W1KSZ

How much would you want for it, instead of converting it? I operate 6
meters and could use it.

It seems these days every chip I want to use in anything is only valuable in
TSSOP format. The leads are so small my smallest soldering iron covers
three pins at a time. It's hopeless.
Does anyone have any words of experience here?

I wouldn't want to drive my Jeep in there. I might get bogged down in the mud!

Radio, lets see, echolink (AM) or skype (FM) with video tonight...
My biggest complaint about echolink is that all the calls with a
3 in them are grouped together, even if the 3 call is not in 3 land.
There needs to be an update that allows one to designate which area
they're really in. I can't stand seeing FL, CA and HI and can't find
the ones that have moved here and kept their 2 or 9 call.

Exactly! You're grouped with the left coasters!

1165. STANDARD C5718DA HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-18 04:03:15 UTC
From: Bob <babushka{AT}dom{DOT}com>
Message-ID: <GfCdnQNTwfsfG4bZ4p2dnA@comcast.com>
Source record: 10551

I'm looking for the microphone extension for the STANDARD C5718DA mobile dual band radio. This is the model with the display and all the controls in the microphone.

What I need is the extension cable so I can mount the radio in the trunk.

The cables I need are (any will do):

CAW571
CAW572
CAW578

I would even settle for the CAW570, which is a microphone "y-adapter" cable which allows you to hook 2 microphones to this radio. I could use those connectors and make my own extension cable.

BTW, does anyone know what type of connectors that STANDARD used? It is not the common 8-pin microphone connector.

Thank you!

martyd{AT}comcast{DOT}net

Um, Dah!.. that's a given.. Of course I read all about solder paste and hot air guns and ovens. But each of them take it for granted that you have a ckt board to solder the chip.. But as we know, breadboarding is for hand wiring while you build up your project. It looks to me like the days of breadboarding is just about dead. If I had a cktboard to solder the chips to, it would mean it was someone else's design and I'm then just a kit builder. This hobby has a lot of facets to it. ckt development and experimenting is what kept me going all these year. But to me, it looks like the deck is stacked for us old guys and Ham Radio in general. We will all soon be appliance operators.. Toasters with microphones!

I assume you are talking about the pencil type irons. If so, you can
put the point in a drill and carefully sand or file the diameter down.
Of course, without the copper coating, the point won't last as long but
this is a quick and dirty way to achieve what you desire.

Message-ID: <ZnOSf.249877$oG.46827@dukeread02>
Source record: 10560

Standard CSA-181A Rapid Charger - desktop charger. Charges in 1 to 2
hrs, w/Automatic switching to safe trickle charge mode. This charger can be
used with several batteries. I used it with my
Standard C-168A HT Batteries. It has the Type 2 Insert for those type
batteries. I understand that other Inserts can be used so that it can charge
other Standard, ADI, and JRC Batteries such as CNB-151,152,153,162,163, &
ADI-600 packs. But this charger includes only the one Insert. Price is $40
shipped. Thanks,
Charlie Hugg, K5MBX

You may try contacting Matt Adrian at sarts@qtm.net. He still repairs
Standards.

I do not know about the C5718A, but I have 3 C5900's and the mike
connector on them is a garden variety RJ45 modular connector.

Hi,

I am looking for an Alpha Linear amplifier. I have contacted the factory they can supply a new model 99 in 4 weeks.

Can you seen any problems in buying the 89 available on eBay (5881107129) or do you think that I am best to buy a new from the factory ?

I have heard that these older series have better, EIMAC, tubes.Is that correct ?

Thank you for all your help in this matter.

Hi Peter

I did some searching and came up with these results.

http://www.qsl.net/ke4mob/
http://www.mods.dk/index.php?ListManuals=mfj
With mods.dk register for a free subscription. The 1278 manual they
have does not show the schematic but is a 407 page (1.806kb pdf)
manual.
Not sure if this will help.

Belden made this cordset in two versions, 17280 & 17952. This is
from the 1979 Belden catalog. They differ in which pin goes to line and
neutral. ECM-280 & ECM-952 from http://www.electri-cord.com/product.html
are supposed to be the replacement for the Belden cables.

Mouser lists the Belden 17952 as non stocked item, # 566-17952, but has
a $5.75 price for single quantities:
<http://www.mouser.com/index.cfm?&handler=data.listcategory&D=*56617952*&terms=566-17952&N
tt=*56617952*&Dk=1&Ns=SField&N=0&crc=true>

<http://www.electronicsurplus.com/commerce/catalog/product.jsp?product_id=77332&czuid=1125
471856053>
is a surplus dealer, showing 13 in stock.

I had one, and sold it because the display did not have enough contrast
to see in a car on a sunny day. It's basically a solid radio, but only
if you intend to use it as a base station.

OTOH, I have a "lifetime supply" of male, panel mount IEC
style power connectors if anybody is as anal as I am and
converting their old equipment power cordage to current
standards. (Just so I don't have to deal with those old
standard cords, etc.)

I have some, too, for the aformentioned project.... but I have decided
I'd rather not hassle with the replacment in this case, even though its a
better idea.

1195. FS Nice HP 410C VTVM

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-19 17:51:34 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <wSgTf.270359$oG.138996@dukeread02>
Source record: 10581

The 410C replaced the 410B and was eventually the last VTVM ever
produced by hp. This one comes with the optional AC probe. The probe has a
vacuum diode inside it's body - it will warm-up you hand. The amplifier is
feedback stabilized, so the pointer shows absolutely no swing when applying
a signal. The Model 410C is an extremely versatile general-purpose
instrument for use
anywhere electrical measurements are made. The Specs are below:
AC Response 20Hz to 700MHz
Output 1V f.s.
Power 13 watts
Dimensions 6-1/2" x 5-1/8" x 11"
Weight 8 lbs (4 kg)
Technology tube, transistor
Price (for 1968) $ 425 w/ AC probe
My price for this one is $125. It is in great shape. I can send digital
pictures. Thanks, Charlie Hugg, K5MBX

You're not supposed to be able to see it even when young.

We have a spiffy binocular zoom microscope on almost every bench at
work.

I''ve pretty much given up on building hobby projects though - don't
have the right tools at home, don't have time to use the right tools at
work.

1197. FS: Drake TR-4Cw/rit + AC-4 + MS-4 combo

Source record: 10583

FS: Drake TR-4Cw/rit + AC-4 + MS-4 combo

The TR-4CW/rit was one of the last off the line, serial no. 45311, and has the hard-to-find 34-PNB noise blanker installed, which I've seen go separately for $200. It is extremely clean, a conservative 9+. Flawless front panel except for one 1/8" scratch below the RIT button. Cabinet top is perfect. Both sides are perfect except for one very small scratch on the left side. Chassis is clean, no corrosion, no smoke deposits. No evidence of modification. Two extra crystals are installed for full 10M coverage.

The AC-4 power supply is installed inside the MS-4 speaker cabinet. The MS-4 has a few superficial scratches on top. The front grille is perfect.
Interconnect cables and repro manual included.

Make serious offer
Ready to sell.

1200. Uniden SMU 300K (How to operate?)

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-20 06:47:57 UTC
From: gkelly@noemail.com
Message-ID: <kpjs121g3ss7t2u8c05hdaksbe406n398b@4ax.com>
Source record: 10587

Hello

I went to a local auction where a hardware store and small engine repair business went out of business. I came home with boxes of small odds and ends. One box had what I thought was a CB radio, but it turned out to be a Uniden SMU 300K commercial radio. I have been googling around trying to find out some info on it, but out of about 40 hits on google, with well over half of them being outdated Ebay ads, (I sure wish Google would remove outdated junk), I only found one site with a small photo of one, and no further info.

This is the same radio, as the photo I found.

Anyhow, I am not very familiar with commercial radios. I do know quite a lot about CB though, so I know this is similar except the frequency.

What I am trying to find out are a few things. What is these radios used for? I mean what is the band they use, like is is police, fire, business only, or what? Several of those obsolete Ebay ads said in the description they are a UHF 450-470 MHz Mobile Radio (another said 440 - 470mhz.

My next question is legality. Can I legally transmit, or do I need some sort of license? If I do need one, can I test it without a license just for a few minutes?
(I am a farmer, live out in the boonies, so there is not much radio activity around here). I have a police scanner so I should be able to hear myself. But before I do all of that, I will need the right antenna. I got several CB antennas but I know that is way off on the wavelength. I imagine for listening, I can use one just to try it, but not to transmit.

I am just asking all of this first. I have not powered it up yet, and for all I know, it could be dead, although it is clean and complete. I dont want to blow it up so i am asking about it first. I also dont want to buy an antenna or get a license or anything until I know it works.

One other thing. I dont see any holes for a speaker. Does the sound come out of the mic, or what? On the rear there are only the red and black power wires, the antenna connector, and a square plug with a jumper wire.

All help appreciated.

Thanks

George

At this hour? At home in bed, I presume.

> and why do you violatethe Tos of Google

So far, I haven't. Why do you suggest I do?

You see, Mork, I can call you an idiot, a fool, a liar, a deviate,
a coward, and a cheat in this forum because at one time or another
you've proven all of them to be true.

It's not a "violation" if it's true.

YES you will need a license before you can transmit, NO a CB antenna won't work, YES you will need to know what frequency and cut the antenna to the correct resonant length, YES it will most likley have to be modified to operate in the ham bands once you are licensed to do so, NO I can't tell you any more without actually *seeing* the radio, or the book for it.

Thanks for the reply.
three questions come from this.
1. Where or how does a person get a license?
2. What do I look for to get an antenna, is this something I can get a
Radio Shack, or what?
3. I know I can test the radio to see if it receives, but how can I
test to see if it transmits? (without getting a license first)?
[I mean, is there a place that will do this, or can I have another
person who has a license do it, or what? I noticed there is a local
business that uses this frequency range, can I have someone there test
it for me?

Thanks

Check with your local HAM Radio Club, or your local FCC office.

> 2. What do I look for to get an antenna, is this something I can get a
> Radio Shack, or what?

Look for the radios frequency capabilities, then build and cut the antenna
for those frequencies. Its real simple math.

> 3. I know I can test the radio to see if it receives, but how can I
> test to see if it transmits? (without getting a license first)?

You can't

1213. West Mountain Radio PWRgate -- What's inside?

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-20 21:10:48 UTC
From: "Percival P. Cassidy" <Nobody@NotMyISP.com>
Message-ID: <sTETf.3680$366.977@fe06.lga>

Anybody opened up one of these PWRgate devices to see what's inside?

What diodes are they using? I can't find any 80A Schottky diodes in the Mouser catalog.

Does it consist of any more than two diodes, a resistor for the float-charge capability, the connectors and the heatsink?

"Perce"
(aka Alan NV8A)

I would guess that it is 2 Schottky rectifiers back to back, with an additional resistor-diode across the pair to keep a float charge on the battery.....

The 203CNQxxx series from International rectifier comes to mind in this application, as basically it is one modual that is surface mounted...

Do a search for PWRgate, and go from there. You SHOULD be able to brew your own from the info found....

1215. WANTED: Museum seeks B-17G Flying Fortress radio/radar equipment

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-21 03:34:28 UTC
From: k5dh@qsl.net
Message-ID: <AridnZeHf8rZ6YLZRVn-iw@centurytel.net>
Source record: 10501
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

WANTED: B-17G Flying Fortress radio equipment

This is a long message... please read it all!

The Vintage Flying Museum of Fort Worth, Texas, home
of B-17G N3701G, "Chuckie", is seeking DONATIONS of
any kind of radio and radar equipment that would have
been used aboard B-17G's built from early-1944 on.

Our airplane is a B-17G-70-VE, serial number 44-8543A.
She was built in January, 1944, by the Vega division
of Lockheed (B-17G's were built by Boeing, Douglas,
and Vega). She was converted to a "pathfinder" model,
which means she had a radar set installed in place of
the ball turret which allowed bombing through overcast.
Very few Forts were converted for this mission, and it
is possible that our Fort saw combat time over Europe.
The combat records of the pathfinder Forts are still
classified, so we may never know for sure.

Right now, the only original radio gear installed in
the airplane is a BC-348-P receiver and shock mount.
We need everything else. Some of the specific items
we seek are the BC-375-E transmitter, tuning units
TU-4B through TU-10B, BC-306 antenna matching unit,
the wooded tuning unit storage rack that mounts to the
rear bulkhead, ceramic feedthrough insulators, power
and control connectors, and cables. We're also looking
for command set transmitters, receivers, racks, cables,
control boxes, spline cables (the LONG ones that will
reach the flight deck ceiling), modulator, and so on.

Obviously, we are looking for NICE equipment that is
in display condition because we display the airplane
both in the Museum and at air shows and fly-ins. We'll
certainly accept donations of "parts units", but the
primary focus is on acquiring gear that looks good
enough to be installed in the airplane. We want to
impress our tour guests at the air shows with a great
looking radio room! Do you have some surplus military
WW2 airborne radios stashed in your garage or attic?
Would you like to see them go to a good home? Please
donate your equipment to VFM and help us restore the
radio compartment in our beloved B-17! Any radios and
accessories that we don't use in the airplane will be

either put on display in the Museum's exhibit hall or sold off to generate money to help finance the effort (no matter how much gets donated, we'll still end up having to buy some stuff to complete the job!).

We are a small museum, and we have very limited funds available to spend on things that don't actually help us to keep the airplane flying. We are looking for DONATIONS of equipment. We are a 501-c-3 tax-exempt charitable organization, and we will provide a tax receipt for your donation.

"Chuckie" is one of approximately 15 B-17s worldwide that are still in flyable condition, and one of about 10 that is flown regularly. Please don't "bash" me if my numbers are off by a plane or two; the numbers go up and down as some Forts come out of restoration and others go down for heavy maintenance or retirement. She participated in the fabuluous Thunder Over Michigan air show in 2005 in which EIGHT of the remaining B-17 population were not only present at the show, but flew together! It was the largest gathering of civilian B-17s in history, and it may never be repeated.

Please visit the Museum's web site:

http://www.vintageflyingmuseum.org

I have been authorized by the Museum to be the focal point for this effort. Please address your messages directly to me.

We're also looking for a complete chin turret if you happen to have one stashed in your barn! Actually, we will graciously accept donations of ANY B-17 parts that you might have lying around. :)

My final request is this: If you have nothing nice to say about this effort, please say nothing. If you are not a warbird fan, if you believe our effort is a waste of time and money, if you think we're "glorifying" war, if you think operating antique warplanes is dangerous and should be outlawed, etc, etc... you're entitled to your opinion, but I respectfully ask that you keep it to yourself.

Thanks and 73,
Dean Hemphill, K5DH
Vintage Flying Museum member

I haven't tried that yet. I usually have something to write over it,
but I did run into some thing strange. Some how I managed to get the
"beep" turned on so every time I'd key it it'd send out a beep. No
matter what I tried I couldn't ge tit to quite. I need to download
the comander software.

That's why I was asking. But why were you suggesting 200A diodes? I find that Newark has the 80A International Rectifier ones (and 80A is what WMR says is the rating of the diodes they are using) in stock, cheaper, and with a lower voltage drop. (I guess that Mouser for some reason simply doesn't handle IR products.)

Up to this point I agree with everything you have to say.

But I'll say what I please about your efforts, and defend to the death
the right of others to say it, as well.

You don't have to like it, and you don't have to read it, either, but
everyone else is as entitled to state his, her, or its opinions on old
warbirds as you are.

That said, I hope you're successful in your quest.

********** REPLY SEPARATOR **********

I'm appalled to see your group is flying this priceless airplane.
Sooner or later someone will crack it up and there will be one less for
future generations to see. Please put pressure on your group to ground
it permanently and preserve it forever so out great-great grandchildren
and all future generations can have the opportunity to see the real
thing and not some replica.

I haven't tried that on my VX-7R, but I think that all the radio does is
skip over them when one, for example, scans through the memories.

By comparison, my FT-2800M base unit allows me to clear a specific
memory and then reprogram it later, if I wish. I've done that several
times when I programmed it for some of the repeaters in my local area.

Bzzzt, Wrong, would you like to try again for what is behind Door #3...

In the USofA, there hasn't been a requirement for Licensed Techs, for
at least 10 years, in Part 90 radio systems. The only Licensed Tech
requirments left in the USofA is for Part 80 (Marine) and Part 87
(Aircraft) Radio systems, and this is due to International Agreements
that the USofA is signitory.

It's not the current rating, its the way you would mount the diodes, I just like
the idea of it being easier to isolate the circuit from the heatsink.... I
believe it's just a bit safer....

In a nutshell it boils down to demand. Do you still drive a non-air conditioned, stickshift, non power steering, non power brake car? Right. Few other people do, either! If you had a choice for driving a 100 mile trip which would you choose, a 2006 Impala or a 1931 Model A Ford? Not trying to be a smart aleck, but it answers the question! :) People just don't want that anymore. Same applies to ham radios. I MUCH prefer my IC-706 MKIIG's to the old 85 lb transmitters and receivers of yore!

Unreal..... Lemme guess, you collect boatanchors, restore them, then refuse
to power them up?
Someone once told me ham radio is a 'condition', not a hobby. I'm starting
to think he was right.

Wow that hit the mark Jerry
I might add if you want a TS-130S kind radio -- buy a used one, have it
restored if need be.
My experience with Hams is the young ones (computer savvy) have no problem
with programming and menus, but lots of old timers seem to.

Yes, but he has a point. Our cars have had those features since the
fifties. Ham radio on the other hand, has gone crazy with the bells
and whistles since that time. Just look at radios like the Icom 7800
and the Yaesu FT DX 9000MP ($12,000 for crying out loud.) I'll bet
people who owns these things don't use half the knobs and buttons.
The owner of a new Impala would probably use everything on the car.

So; if they don't fly it, don't keep it airworthy, what if a hurricane comes along, does it just sit and wait to be ripped to shreds? More power to them, if they fix it they should fly it. I know of a collector of fine rare cars, he isn't afraid to send them off to vintage races or put them on the road. I am also amazed how collectors rebuild from almost zero remains, so even if it gets busted up...

1233. New Program. Transmission Line Transformers

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-22 00:41:36 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <dvq6g0$1sh$1@nwrdmz03.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 10518

There are two transmission lines in cascade plus a load impedance.

The first line can be considered to be the main line from the
transmitter.

The second line can be considered to be an impedance matching
transformer between the first line and the antenna.

What is the impedance and length of line in the transformer if the
antenna feedpoint impedance is not purely resistive?

What are the input impedances of the two lines, R+jX ?

What percentage of transmitter power is dissipated in the two lines?
What is the overall power efficiency?

The answers can be found in new program TWOLINES.

SWR is not involved.

Download program TWOLINES from website below in a few seconds and run
immediately.

The only thing you have to have "original" on an aircraft is the data plate. Everything else can be salvage, new parts, homebuilt parts, whatever. The data plate is the key.

From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <L_1Uf.30$KE1.22@dukeread02>
Source record: 10522

I have a like new condition Mosley Classic 33 HF Beam for sale. It the late model CL-33-M and currently sells for $650 from Mosley. It has great gain on 20, 15, and 10 meters. It has a 18 foot boom.This one
was up for a little over a year and looks brand new. It has been taken down and is partially disassembled. It would be very easy to put it back together again since all pieces are color coded. It also would fit into a
pickup truck for transportation. The price is $300 picked up. I don't want to ship it. Or I can meet someone within 100 miles of Abilene, Texas.
Thanks, Charlie Hugg, K5MBX

Almost looks like a Kenwood 7400A with a different front panel, the
controls are similar. Kenwood did make products for other companies.

>Dick - W6CCD

I was sitting on the phone at Icom when the original 706 did not
receive the weather channel very well. I can tell you the hams would
not have it that way. I can remember hearing over and over an amateur
transceiver that works in the 2 meter VHF range just has to be able to
reveice the weather channel otherwise it was useless. Take the W32A,
receives the weather channel like gang busters on the supplied rubber
duck, it was done by design.

Someone came up with a as I remember the " Yellow " wire mod for the original 706. That mod actually enabled the 2 meter bandpass filter when tuning above 148 MHz where it was turned off stock form the factory.

Seems today's amateurs want a amateur transceiver and one that has a wide receive too. I have often wondered how many rigs would be sold if one could not alter the transmit range. Both seem to be pretty standard on the check lists when purchasing a new rig.

I purchased a brand new IC-730 in 1982 at Dayton. Then I longed for shortwave coverage and 10 FM. I did find an aftermarket FM board for it from a person at Dayton the next year or two It worked great. So with a quadruple conversion receiver I was not real happy as I could not tune the shortwave bands. I now have an IC-718 and hardly ever tune outside of the ham bands now that I can. :)

I agree if the companies could build a nice helical filtered ham band only front ends the overload and adjcent channel complaints would go away mostly.

Its an interesting hobby and also to listen what users seem to want in a radio.

Thanks for the memories.

Gary K8IZ

What're you doing, Charlie, getting out of the ham business? Are you planning to be in Abilene at the end of July? If so I'd like to meet up with you. I'll be there for the 774th TAS re-union, celebrating (?) the 20th anniversary of the deactivation of the squadron. I was there from '79 - Jan '85 and had some great times there. Member of the KCARC, and all that. If you still have the MC-50 when I get there I might be interested in relieving you of it.

An airplane that is not flown is so much scrap metal. They were designed
and built to be flown and in the air is where they belong. If someone wants
a static display let them build a replica.

Add to that the fact that this 'priceless airplane' is only such
because this group invested heavily in its existence. Without their
contribution of time, effort, money and hardship, it would--in
fact--(still) be only so much scrap metal.

Y'all don't suppose that Bill posted his little rebuttal simply
because the OP politely asked him not to? Something about "stirring the pot"
comes to mind.

> For crying out loud Mike, was that TRULY necessary?

I think it was. Usenet is in many ways the equivalent of Speakers'
Corner in Hyde Park, London. omeone trying to foreclose comment on
his project, after he posts about it on Usenet, is in the position
of telling the folks around him at Speakers' Corner that they can
listen or not, aas they please, but they aren't to comment.

I've been doing this Usenet stuff, for work (mostly) and play since
1983 or so, well before hoi polloi had access to the big-I Internet,
and I want to keep its open flavor intact.

You have the right to have a different opinion, and (unlike k5dh), I
won't ask you to keep it to yourself.

No, Bill posted his little rebuttal because he thinks the OP is an idiot but hopes he will come to his senses anyway.

Throughout history there have been many irreplaceable treasures lost because nobody thought future generations would might like to see the original instead of a replica. A real, genuine B-17 is a priceless relic of an age that will never be repeated. Save it.

Mr Bill

Well, I am sorry to hear that Bill. You obviously aren't familiar
with the major causes of loss in restorable antique aircraft:

(In approximate order)

1) lack of people willing to pay for restoration
2) hanger fires
3) natural disasters.

I have seen a few rare aircraft that have crashed, and guess what?
As soon as they get the pilot out, they go back into restoration.

There seems to be loads of money available to restore antique aircraft
to flight, but little available for restoration to static display.

And in my opinion, that is exactly how it should be. Whoever pays
the freight gets to decide how the plane is used. Everyone else
is just a spectator.

If you feel that way you should purchase them and put them in a museum.
Most would not have survived and will not survive without the intent to fly.
Not much money available for the restoration of static displays. Lotsa
money available for flying restorations. Glaicer girl is an excellent
example.

Heh, I'm as real as it gets, brother.
So you do collect boatanchors? Do you also have an attic full of empty radio boxes? I'm betting you do.
But that's your choice, now isn't it? And nothing wrong with it.

On the power-up thing,
I disagree, citing that it depends on how much power is applied to it.....
:-)
Or it could catch fire and burn to the desk... or the ground... or if it were donated to a B-17 restoration, it could very
well end up splattered all over a hillside somewhere... LOL.

And yes, *I* get it.... enjoy what you have or what's the sense in having it??
Moth-ball a vintage plane in Tucson, AZ or some museum, and I'll NEVER get to see it. Fly it to my local fly-in and I do...
[said while gazing up at the photo of my daughter sitting left-seat in the Texas Raiders 17g when it was HERE at a fly-in.]

Everything is disposable and it certainly doesn't transgress to the 'other side'.

Use it or lose it; 'cuz cars are for driving, radios are for driveling into, and an aircraft is for flying.

There's a fine line between being a
keep-the-box-because-it-matters-to-other-boxkeepers packrat, and preserving history.

Do *you* get it??

And the Memphis Belle is an example of a static display going down the tubes.
Still not finished and now moved to Dayton, the US Air Force museum due to
lack of funds to keep the Belle in condition. Those machines were meant to
fly and should be flown. It's really sad to see them rot away on the ground.
In the air they are living history, and give peole a chance to experience the
ground pounding thunder of their mighty engines as they soar overhead. And
very ocaisonally one may get the opportunity to fly in one of them if they
are very lucky as a friend of mine did a few years ago in one of the last
Lancaster bombers left flying.

Absolutely, I get it.

You and the two or three posters who agree with you are self-centered pigs who care nothing about preserving history. Your temporary adrenaline rush is much more important, and the risk of splattering a priceless aircraft means nothing beside your momentary thrills. How sad that people like you are allowed to own such an aircraft.

A hundred or five hundred years from now, if your ilk prevails, people will be saying "Gosh, I wish someone had kept a B-17G preserved somewhere. I would have really loved to see the real thing".

I hope and pray there are not many like you.

Bill T.

Bill is 100% correct. He should negotiate and buy the plane from the restorers for its priceless value, say $50-100 million, he can then store it and show it to whomever he pleases! That is the American way!

Bill is 100% correct. He should negotiate and buy the plane from the restorers for its priceless value, say $50-100 million, he can then store it and show it to whomever he pleases! That is the American way!

He won't buy it. All the weenies that complain about somebody else spending their own money to restore and use something will do nothing except huff and puff like the litlle piggies.

I plug in my boat anchors. I heat my shop with an FRR 59 . I would never think of just leaving it sitting there collecting dust and rusting away.

Do you get it??
rb

********** REPLY SEPARATOR **********

Absolutely, I get it.

You and the two or three posters who agree with you are self-centered pigs who care nothing about preserving history. Your temporary adrenaline rush is much more important, and the risk of splattering a priceless aircraft means nothing beside your momentary thrills. How sad that people like you are allowed to own such an aircraft.

A hundred or five hundred years from now, if your ilk prevails, people will be saying "Gosh, I wish someone had kept a B-17G preserved somewhere. I would have really loved to see the real thing".

I hope and pray there are not many like you.

Your boatanchor will not be destroyed by plugging it in and using it on your bench at home. No problem there.

On the other hand, if it is one of a very few remaining, it might not be a good idea to take it on a one-man kayak DXpedition across the Bering Sea in winter.

Airplanes crash, especially ones flown and maintained by well-meaning but inexperienced pilots and mechanics who are usually short of cash, spare parts and time, and who, sooner or later, will feel the pressure to fly it when they really shouldn't in order to keep an airshow schedule.

Park it.

Bill T.

Jeeze Loooo F***in' Weeze Folks! Stop the Global Whining! I don't care about the first post and the request for no BS...you can ask for what ever you want. Now....anybody else gonna pony up a part or two toward having a B-17 with a representative radio position? From what I've learned the radio position will be for display not a necessarily a full on operating position. That is OK in my book, better than an open hole. The op and his group can always have a radio position outside the airframe like Dave Stinson had in Texas that can be set up next to the airframe and operated where lots can see it. Anyway, I gave a grunch of radio gear to LST325 that worked because they wanted to set up an operating radio space. No probs sending some look-at ARC-5 to a B-17. Anyone else going to send some parts? Or just blab?

EdZ

Aww...that's too bad. I only saw her once back in the 80's and she
looked fine back then. I guess I should have questioned (in my mind
anyway) the wisdom of keeping her in open air beside--no, in the middle
of (Mud Island - Memphis)--the Mississippi River; but they went to a lot
of trouble to get her there. It's a shame to have abandoned the effort.

This is a case of perhaps a machine which should only be static
displayed. She's not one of the thousands of anonymous 17's remembered
only by their dwindling numbers of surviving crew; but rather a piece of
history with an unparalleled combat record at the time of her retirement.

She's done her bit...

Gidday All,
I have just updated my Website with some lovely and
hard to find ICOM Radio's forsale.

There's a VERY RARE IC-1275... 23 cm Radio... plus an IC-475, IC-375
and an IC-271/471 & 1271 Package available too.

Serious Buyers only please...

Cheers and thank you,

Alan - VK3XPD

Holy cow, what a firestorm I've started!

In my original post, I should have included the following statement (which might have avoided this useless fight):

Please keep your opinion to yourself BECAUSE THIS IS NOT THE RIGHT FORUM FOR SUCH A DISCUSSION (on whether it's right or wrong to fly vintage aircraft, etc). I surely did not mean that we all can't have our opinions. This IS still the United States of America, and that IS still one of our most basic, cherished freedoms. I, too, would fight to the death to defend those freedoms. However, there is a time and place to discuss any topic worth discussing, and this simply isn't the place for the "fly or no fly" topic. This is a forum for discussing radios, not the politics of aviation.

Of course, hindsight is 20-20. I apologize to the group for opening the flood gates and inadvertently getting this inappropriate firestorm started.

I'll toss in my comments, since the horse has long ago escaped from the barn.

For those who believe that we should ground our B-17 to preserve it for future generations, lest it might someday be destroyed and no one will get to see one in the future, fear not. There are literally dozens of B-17s on static display all over the world. A few of those static restorations are superb (witness the USAF Museum's Shoo Shoo Shoo Baby), while a many other static planes are cobbled-together airframes that are literally rotting away on outdoor display. One need only look for static B-17s, and they'll be relatively easy to find. They're not really in short supply.

Someone mentioned seeing Memphis Belle flying back in the 1980s (I think that's what they said). Memphis Belle has not flown in decades. There is another "F" model that's painted to represent the Belle, and that aircraft is a regular flyer on the show circuit. As I recall, it's the only flying "F" model.

The comment about many vintage warplanes crashing due to poor piloting and poor maintenance is right on the

money. These old aircraft require a LOT of work to keep them safely operational, and they require a LOT of pilot skill and training to keep the pilots from making the poor decision that lead to crashes. Many groups have fallen into this category (including the mighty CAF), but that's changing. We're seeing a big trend toward proper restorations (not just patching airplanes together) and proper training of pilots and crews. The safety records are getting better (though we certainly have a long way to go). The warbird community recognizes that slip-shod restoration work ain't gonna cut it, and pilot training has become the big focus that it should have been in the past. We're not out of the woods yet, but we're a LOT better, and continuing to improve.

VFM's chief pilot (and the actual owner of our B-17) is one of the few B-17 flight instructors in the world. He's owned and flown this particular airplane since the 1970s. Our chief mechanic is a lifelong A&P mechanic (also a ham!). Our maintenance schedule is thorough and very rigorous. NOTHING comes before safety, on the ground and in the air. Our ground and air crews go through recurrent annual training and constant on-the-line training. If there's a problem, then the airplane does not fly. It's as simple as that. No airshow commitment is important enough to risk the lives of our crews or the safety of the airplane. As I stated before, the reason we don't have money to go buy vintage radios is that our money goes into the one really important thing: the airplane itself.

OK... as Ed Zeranski pointed out... the purpose of my original posting was to try to acquire original radio gear for the B-17. So far, a lot of people have come out of the woodwork to argue and fight and whine, but Ed's the only one who's actually offered to donate anything (other than myself; I donated a nice ARC5 transmitter from my own station).

As I told Ed in a private email, the chances that we will be able to put together a working station aboard the aircraft are pretty small. So far, no other '17 has a working station, though several of them have a nice set of original radios installed but not wired. We won't rule out the possibility of getting some of the gear to work (at least the BC-348-J receiver), but since all of the required wiring was removed from the airframe decades ago, it would be daunting task that would require a lot of money and volunteer hours. We prefer to spend the money keeping the airplane in

proper, safe flying condition, and using her to share
history with those who come to the museum and to the
air shows to see and appreciate it.

I said in my original post that we have a BC-348-P on
board the '17. I was mistaken. It's a BC-348-J. I
didn't have my notes handy when I wrote the post.

So... GENTLEMEN... let's halt the "fly - no fly" part
of this thread... let's agree to disagree and get back
to the original purpose. If no one is interested in
helping us out, that's fine. We will survive. Let's
just stop all of the arguing and whining. This isn't
the right forum for it. Write to the FAA and ask them
to stop allowing us to fly. Write to Air Classics and
tell the world why what we do is wrong (and yes, Mike
O'Leary WILL publish letters of dissent!). Stand out
in front of our museum entrance and hand out flyers to
our guests if you like. Let's just re-focus on radio
gear here on these newsgroups! Please?

73,
Dean Hemphill, K5DH

Well if you had asked for the radio gear without your horse shit caveat,
rules and regulation probably no one would have responded.

>>WANTED: B-17G Flying Fortress radio equipment
>>
>>This is a long message... please read it all!
>>
>>The Vintage Flying Museum of Fort Worth, Texas, home
>>of B-17G N3701G, "Chuckie", is seeking DONATIONS of
>>any kind of radio and radar equipment that would have
>>been used aboard B-17G's built from early-1944 on.
>>
>>Our airplane is a B-17G-70-VE, serial number 44-8543A.
>>She was built in January, 1944, by the Vega division
>>of Lockheed (B-17G's were built by Boeing, Douglas,
>>and Vega). She was converted to a "pathfinder" model,
>>which means she had a radar set installed in place of

>>the ball turret which allowed bombing through overcast.
>>Very few Forts were converted for this mission, and it
>>is possible that our Fort saw combat time over Europe.
>>The combat records of the pathfinder Forts are still
>>classified, so we may never know for sure.
>>
>>Right now, the only original radio gear installed in
>>the airplane is a BC-348-P receiver and shock mount.
>>We need everything else. Some of the specific items
>>we seek are the BC-375-E transmitter, tuning units
>>TU-4B through TU-10B, BC-306 antenna matching unit,
>>the wooded tuning unit storage rack that mounts to the
>>rear bulkhead, ceramic feedthrough insulators, power
>>and control connectors, and cables. We're also looking
>>for command set transmitters, receivers, racks, cables,
>>control boxes, spline cables (the LONG ones that will
>>reach the flight deck ceiling), modulator, and so on.
>>
>>Obviously, we are looking for NICE equipment that is
>>in display condition because we display the airplane
>>both in the Museum and at air shows and fly-ins. We'll
>>certainly accept donations of "parts units", but the
>>primary focus is on acquiring gear that looks good
>>enough to be installed in the airplane. We want to
>>impress our tour guests at the air shows with a great
>>looking radio room! Do you have some surplus military
>>WW2 airborne radios stashed in your garage or attic?
>>Would you like to see them go to a good home? Please
>>donate your equipment to VFM and help us restore the
>>radio compartment in our beloved B-17! Any radios and
>>accessories that we don't use in the airplane will be
>>either put on display in the Museum's exhibit hall or
>>sold off to generate money to help finance the effort
>>(no matter how much gets donated, we'll still end up
>>having to buy some stuff to complete the job!).
>>
>>We are a small museum, and we have very limited funds
>>available to spend on things that don't actually help
>>us to keep the airplane flying. We are looking for
>>DONATIONS of equipment. We are a 501-c-3 tax-exempt
>>charitable organization, and we will provide a tax
>>receipt for your donation.
>>
>>"Chuckie" is one of approximately 15 B-17s worldwide
>>that are still in flyable condition, and one of about
>>10 that is flown regularly. Please don't "bash" me
>>if my numbers are off by a plane or two; the numbers
>>go up and down as some Forts come out of restoration
>>and others go down for heavy maintenance or retirement.
>>She participated in the fabuluous Thunder Over Michigan

>>air show in 2005 in which EIGHT of the remaining B-17
>>population were not only present at the show, but flew
>>together! It was the largest gathering of civilian
>>B-17s in history, and it may never be repeated.
>>
>>Please visit the Museum's web site:
>>
>>http://www.vintageflyingmuseum.org
>>
>>I have been authorized by the Museum to be the focal
>>point for this effort. Please address your messages
>>directly to me.
>>
>>We're also looking for a complete chin turret if you
>>happen to have one stashed in your barn! Actually,
>>we will graciously accept donations of ANY B-17 parts
>>that you might have lying around. :)
>>
>>My final request is this: If you have nothing nice to
>>say about this effort, please say nothing. If you are
>>not a warbird fan, if you believe our effort is a waste
>>of time and money, if you think we're "glorifying" war,
>>if you think operating antique warplanes is dangerous
>>and should be outlawed, etc, etc... you're entitled to
>>your opinion, but I respectfully ask that you keep it
>>to yourself.
>>
>>Thanks and 73,

Perhaps it will help if you realize this is an unmoderated, free, open forum.
As such all sorts of folks lurk here. (from the bottom to the top of the scale)
Many obviously with no knowledge of warbirds and restorations there of.
The best way to avoid the "firestorm" is to ignore comments not related to your donation request.

I sincerely hope some will come forward for the radio donations, I certainly would if I had some.

This from one who flew in the 50's prop planes (Before the jets)
I fondly recall the ARC-5's, ART-13, BC-348's etc.

My Uncle flew in B-17's & B-24's in the China, Burma, India theater - he would be pleased with your efforts.
Someday his descendents will marvel that men flew in such machines.
Your efforts are a fitting tribute to the men who flew and died in these planes.

I think is admirable for you to try and put them back in their original setting - kudos and good luck
I'll spread the word here in So Calif for possible donors.

PC scanning combo , both in EXCELLENT condition.

Pro-2042 with the Opto 535 installed.

Samsung Sens 690 Laptop. Win XP , Probe , Scancat Gold "SE" , etc.

I am asking $700/BO or possibly trades and cash.

also have a UBC 780xlt in EXCELLENT condition (Both US and European BANDPLANS) $350 / BO Might consider trades , depends.

Alpha Numeric a must and pc control on any trades considered.

Thanks for looking , Tom (aka ScanDaBands on Radio Reference and Stong Signals)

Every now and then I think "I should but those old Mostars to good use" and then I think "boy would this be easier if I had a MIB (Mostar Interface Box)"

So does anyone have a schematic for one? Or one laying around?

I know all the usual sites to look for this kind of stuff, and even one or two places to buy one (for a high price). But I'd rather build it, or find a reasonably priced one.

All help is appreciated

WTB: Collins R-390 spray paint
Hi
Can someone tell me where I can buy Spray paint cans to match the
front panel of the Collins R-390 Reciever?
Any local stores carry a close match??
Also is it difficult to get the panel off?
And any tips on redoing the front panel would be great.
I painted kwm cabinets before, but never did a front panel.
Thanks...Rich
ritchi50@optonline.net

ps: I see the lettering is etched in, so before I paint, do I try to
etch out all the white thats etched in, so when its sprayed I then
put in new white paint?

If you require an exact match Collins paint, you might check out
Surplus Sales of Nebraska,

http://www.surplussales.com/index.html

... they carry a line of paints for the Collins A line, S line, and
KWM380. It is likely that if you call them to discuss the R390 they
might have a color for that in stock.

800-244-4567

On the process of restoring your R-390, you might take a look at:

http://www.collinsradio.org/

http://users2.ev1.net/~wb7dyw/

http://www.collinsra.com/

For auction on ebay is an Advantage SA-1800D spectrum analyzer. Works
but needs the frequency aligned, also the tracking generator doesnt
work. Covers 2-1800mhz, options include Frequency Display, Marker
Generator and Tracking Generator. Runs on 110VAC, comes with foldable
antenna, power cord and owners/service manaul. Manual has schematics
but no alignment procedures. Thanks for looking!

Very interesting that the post asking to stop the arguing and whining
is the longest post of all, by far. In a nutshell, that's the problem.
Only your thoughts are important, only your desires are valid, what you
want is primary above all.

As long as folks like you own these priceless relics, someday the last
one will be reduced to scrap. What a shame.

Bill T.

Yes I know that but the controls are very similar. I was thinking
maybe Kenwood built it for Alpha.

Does the radio have an FCC ID number, I would not be surprised if it
did not since you are not in the US. But if it does looking at the FCC
database would give you some insight.

1296. Looking for help with ADI AT-600 radio

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-25 06:06:00 UTC
From: 2Thirty <jsmollon@chartertn.net>
Message-ID: <1143266760.208098.226480@e56g2000cwe.googlegroups.com>
Source record: 10482

Thank you in advance for looking at this post.

I have been trying to get my wife interested in getting her license for years, and have finally talked her in to studying. I thought I would pick up a dual band radio to surprise her, and like an idiot I bought one from eBay. I picked the ADI AT-600 because it was inexpensive and the display was large enough for her to see.

The ad said "as is" but also said VHF and UHF bands worked. I don't mind weak batteries and a few scratches, and that's about what I expected. When I received the radio the UHF worked fine but the VHF receive was only static. The VHF transmit worked fine.

When I power the radio up, and tune the VHF to a frequency.. say 145.000, and turn another HT or base to the same frequency, I get a signal on the two other radios. About an S7 on the base. Tune the AT-600 off frequency and the other radios receive nothing. The xmit led doesn't indicate it transmitting. With the rig apart, tapping on a few selected smc caps and transistor produces tapping audio in the other receivers. (mic isn't in the same side as the tapped parts)

Transmitting from either radio to the AT-600, it doesn't receive anything.

I am going to get in to this rig and repair it, just out of principal.

A kind gentleman in in California was gracious enough to fax and mail me schematics he had for an HTX-204, which is the same radio made for Radio Shack by ADI. (One of the only references to repairs for this radio on the Internet. He was offering the schematic to someone else looking for it and was nice enough to respond to my request.. still nice guys out there..)

So my question to anyone who may have the time and possible knowledge of this radio is... after checking the grounds and obvious problems, what would be a "high probability" section to start looking at.

Again, thanks to anyone who has taken the time to read this.

Here are a couple of rules to use when buying used equipment:

1. Never buy anything that says "sold as is", even if a live purchase.
The seller knows something you don't until you get your hands on it.

2. Can I buy this new and avoid headaches? You can get a dual bander
Alinco, new from manufacturer for 120.00 It.s a 'lil bitty one that
would have fit your wifes purse. Big selling point for the YLs.

been there, done that

Message-ID: <-YidnX2EG6mC4rjZRVny1w@bt.com>
Source record: 10484

A loading coil inserted in an antenna, or a close-wound helical, can
be considered to be a transmission line. It behaves as such.

From a coil's physical dimensions, program TRANCOIL calculates the
line's distributed Inductance, Capacitance and Resistance including
radiation resistance.

Also Characteristic Impedance, Phase-shift, Propagation Velocity and
Attenuation.

Should the coil be used as an antenna, the resonant frequencies are
found, also the feedpoint impedance, R+jX, versus test frequency.

Input data can be varied via the keyboard to observe how the coil
performs versus length, diameter, number of turns and frequency.

The program is both educational and practical.

Download program TRANCOIL in a few seconds from website below and run
immediately.

The answer is still the same. If you don't want the airplane to fly then
YOU should buy it and put it on static display in your workshop.

If you don't want to buy it then let the people who are willing to
restore it use it as a flying museum.

Hi All

I am having a problem with my Kenwood 732a....I stopped working and would not power on, their was power going to the radio but it would not turn on.

I keep on trying to turn it on by repeating the on off button and now I have a small number 44 showing in the left side of the display and when you push any of the buttons all it does is beep, and now the on off button won't turn the radio off.

Any Ideas Don VE3ULF

No one is keeping YOU from gathering money for acquisition, restoration,
and floor space for a static display.

Or is it just easier for you to piss and moan about the people that are
actually doing something without any personal involvement on your part
other than your pissing and moaning?

Yet you think *you* have the right to dictate to the people that own and
pay for those craft what _they_ "should" do with their own property.

>As long as folks like you own these priceless relics, someday the last
>one will be reduced to scrap. What a shame.

Which will have absolutely *zero* effect on the number of non-flying
"relics" on static display.

Available evidence suggests (*very* strongly, too) that "more or less
NOBODY" wants to spend the money to preserve such static non-flying
display aircraft. That *those* aircraft are being 'reduced to scrap'
today, for lack of interest. "What a shame", indeed.

Not to put too fine a point on it, how much money have _you_ donated to
the support of _any_ "non-flying B-17 static display" organization?

It's always easier to spend somebody else's money, isn't it?

I suspect the appellation 'hypocrite' applies.

I take it you don't speak face-to-face with others very often?
Your low-brow approach to debate is, if nothing else, good for a chuckle.

Looks like you just enjoy arguing without reason; because you're completely
unarmed,
and going in pointless circles with your posts. Try to make a valid point,
please.

>Your temporary
> adrenaline rush is much more important, and the risk of splattering a
> priceless aircraft means nothing beside your momentary thrills. How sad
> that people like you are allowed to own such an aircraft.

LOL... four words: lost ball, high weeds.
What does your above statement even mean???

FYI: Don't EVER research the film industry for any reason.

>
> A hundred or five hundred years from now, if your ilk prevails, people
> will be saying "Gosh, I wish someone had kept a B-17G preserved
> somewhere. I would have really loved to see the real thing".

Wow...? Not sure what to say to that after reading your cumulative posts.
First, please refer to the "lost ball" statement above, then
try to do some research on vintage aircraft clubs, museums, owners and
current displays.

>
> I hope and pray there are not many like you.

Plane-loads! And no thanks to you, we sit about debating whether or not a
Neanderthal with a superiority complex is a paradox.

Mister, it's painfully obvious that your intent is not to prove a point, nor
offer a reasonable debate; but to simply try and talk others down.
You must have a very hollow existence.

I hope and pray you can find a better way to spend your time.

This group has the most complete collection of modifications, usage tips, links to related websites, documentation, and photos along with a user survey and a message forum (4000+ messages archived) to help you get the most
fun and DX out of your Realistic / Radio Shack DX-394, DX394, DX 394.

Over 90 mods and tips now listed plus a dozen on the To Do or Wish List. More mods than for any other general coverage receiver! Thoroughly documented with a Master Index. If you like to tinker with radios, I know of no other recent model that lends itself to as much fun in this arena as the DX-394. Great platform for learning radio-electronics. Always 1 or more FA on eBay.

Active & friendly user community now with over 1000 members. Some members are
keen short wave listeners; others are into AM DXing and a few enjoy long wave. Many experiment with antennas and some are ardent modifiers - customising and souping up the rig as hot rodders would do with cars. You'll find lots to interest you and help get the most out of your radio.

1318. 1000+ Members - Radio Shack DX-394 User Group

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-27 13:42:06 UTC
From: Tom Holden <holden_family@sympatico.ca>
Message-ID: <NYRVf.512$u15.138359@news20.bellglobal.com>
Source record: 10404
Cross-posted to:
rec.radio.shortwave,alt.radio.scanner,alt.radio.scanner.uk,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

(Let's try again with the URL hopefully corrected - I don't understand how they got corrupted in distribution - looks alright leaving here and on screen but the actual properties show an extra character)

This group has the most complete collection of modifications, usage tips, links to related websites, documentation, and photos along with a user survey and a message forum (4000+ messages archived) to help you get the most fun and DX out of your Realistic / Radio Shack DX-394, DX394, DX 394.

Over 90 mods and tips now listed plus a dozen on the To Do or Wish List. More mods than for any other general coverage receiver! Thoroughly documented with a Master Index. If you like to tinker with radios, I know of no other recent model that lends itself to as much fun in this arena as the DX-394. Great platform for learning radio-electronics. Always 1 or more FA on eBay.

Active & friendly user community now with over 1000 members. Some members are keen short wave listeners; others are into AM DXing and a few enjoy long wave. Many experiment with antennas and some are ardent modifiers - customising and souping up the rig as hot rodders would do with cars. You'll find lots to interest you and help get the most out of your radio.

All here at:
http://groups.yahoo.com/group/RADIOSHACKDX394/

Subscribe on line (for full access privileges to the extensive collection of Files, Photos and Links) or by email:
RADIOSHACKDX394-subscribe@yahoogroups.com (for message posting/receipt only).

Which of these mods do you think increase sensitivity at the expense of
dynamic range?

> Remember some of these mods are made by amateurs

Many of whom are electronics professionals. That's not to say that novices
at electronics do not carry out some mods. One of the virtues of the DX-394
is that it can be readily modified and doing so is a great educational
activity for someone getting into radio and electronics.

> The factory engineers designed the sensitivity for very good reasons

And made some mistakes in other areas, e.g., decoupling around the IF
filters, AGC time constant for SSB (factory corrected in the revised
versions), and some design trade-offs or decisions that owners want to
correct. That is true of every product.

Dave, try a Google search using the brand and model. I was able to get the service manual for the old (70's) CDR TR-44 rotator that way. It's amazing what's out there.

I refer you to the Elecraft page
http://www.elecraft.com/K2_perf.htm

Sez
MDS = Minimum Discernible Signal (3db increase above noise floor). Larger
negative numbers are generally better, but too much sensitivity can reduce
strong signal dynamic range and Ip3. Pre-Amp On MDS numbers of -130 dBm or
more are more than adequate for most HF band operating, since band noise is
typically above this number. (Lower frequencies need less MDS (more +number)
due to an increase in atmospheric noise.)

Problem is, many times those reasons have more to do with cost than
with performance.

FS Beautiful Icom IC-751 all mode SSB / AM / FM / CW / RTTY Transceiver 100 watts. Superb condition in both appearance and electronically. Well cared for, works 100%. This radio has always been in a nonsmoking environment. Includes hand mic, original manual, and power cord. Also has the Optional CW Filter installed. Rare to find one in this condition. Price is $400, plus shipping. Thanks, Charlie Hugg, K5MBX

I have no dispute with that. Rather with your first comment:

>>> Just FYI: I see a lot of these mods to increase sensitivity -- resulting
>>> in trashing the dynamic range
>>
>>
>> Which of these mods do you think increase sensitivity at the expense of
>> dynamic range?

You did not answer the question. The answer may well be 'none'. I'm not
aware of any aimed at increased sensitivity, unless adding an amplified
preselector counts as a mod. And that could arguably be for improved dynamic
range and sensitivity by improving front-end selectivity and noise figure.
Most regard the DX-394 as a very sensitive receiver that is outperformed in
that spec by few others. But itcould do with improved overload threshold and
IP3.

Methinks you might be trashing imagined mods rather than the ones
well-documented in the user group.

Tom

The DX-394 is a scanning receiver, reviews have described its user interface
as reflecting a scanner heritage, it has been a topic in all the newsgroups
to which I posted the notice, and similar notices have been crossposted a
few times in all these newsgroups informing potentially interested parties
about http://groups.yahoo.com/group/RADIOSHACKDX394/, without objection.

Are there any other newsgroups for which it would be relevant? The ones I
posted to are:
rec.radio.shortwave, alt.radio.scanner, alt.radio.scanner.uk,
rec.radio.amateur.equipment, rec.radio.amateur.homebrew

I was intrigued by that post and joined the group. DX 394 is quite a bit
part of a listening hobby.

The DX 394 scans a slightly different breed of frequencies...or does it?
My Yupiteru MVT 7100 picks up all those same frequencies also, and then
some. Does that mean my Yupi is technically NOT a scanner because I can also
use it as an AM/FM/SW/SSB/Weather/TV audio/
CB/Communications/Marine/Police/Fire/Ambulance radio receiver as well?

It is a LW, MW, SW receiver that scans. Is alt.radio.scanner restricted to
discussion of scanning receivers that can tune only above 30 MHz?

Do a search in alt.radio.scanner:
http://groups.google.com/group/alt.radio.scanner/search?q=DX-394+OR+DX394+or+%22DX+394%22&
start=50&
- 66 threads found, dating from 1996.

>
> It's also NOT amateur equipment any more than it is a scanner,
> and CERTAINLY not 'homebrew'.

Why is the DX-394 NOT amateur equipment (I assume you mean 'amateur radio')?
It tunes the HF ham bands and does a credible job receiving the popular ham
modes on its own and is used with software to receive many digital modes. It
is found in many hamshacks. My first SW receiver was a 5-tube Heathkit AR-3
general coverage radio - it doesn't hold a candle to the DX-394 - but it was
the receiving part of my ham radio station.

I agree that the DX-394 itself is not 'homebrew' but the many mods are of
interest to some homebrewers as have the design discussions carried out in
rec.radio.amateur.homebrew.

When did you become the self-appointed policer of these newsgroups? As far
as I can tell, my original post was in the spirit of guidelines about
cross-posting. Your carrying on with this nonsensical criticism by
cross-posting replies is not.

End of discussion.

Tom

********** REPLY SEPARATOR **********

You completely missed it, Woody. My only concern here is to preserve a historical artifact which once destroyed, can never be replaced. If the current owners and future owners keep flying it around, it eventually will be destroyed. Hopefully at some point the owners will wise up and say "Enough. Lets park it before it's too late.".

My concern is as simple as that. Please do not read other motives into my posts.

Bill T.

General aviation doesn't need parking as far as I can tell.

The B-17G should be parked in the desert, in a hangar, where there is low humidity and no violent weather. It would last practically forever, and at five or ten bucks a ticket, would be a source of income also practically forever. And guess what... no maintenance cost either, except maybe for a feather duster now and then. :-)

I am looking for a south center meter face for the HamIV rotor. Maybe someone knows of a face JPG that you can download and print on stickey paper. Yes I have checked to make sure that face is not behind the existing north center face.

Also how does one figure out the coils of a TH7DXX antenna. The paint has long gone on most of the traps on mine. I moved a couple of years ago and now getting ready to put it together and installed..... Now how do I figure out the trap locations.....

1353. ICOM AT-150 tuner antenna ports

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-28 18:17:46 UTC
From: KC0JBJ <KC0JBJ.25eeyu@news.radiobanter.com>
Message-ID: <KC0JBJ.25eeyu@news.radiobanter.com>
Source record: 10439

I just bought an ICOM AT-150 antenna tuner to go with my ICOM IC-735 (still looking for that elusive object, a moderately priced PS-55 matching power supply in good condition!).

The tuner has four antenna "ports" on the back. #1,2,and 3 all have SO-239 connectors and are clearly for 50 ohm balance line antennas/feedlines. The fourth port is simply a push-insert-release wire terminal. The manual states that this port may be used for attaching a long-wire antenna for general coverage reception. However, it also states that all 4 ports may be used for transmitting, as long as the SWR is already 3 to 1 or below.

Now I am curious, if this port is for a long-wire antenna (a balanced load, if the unit is well grounded, right?), does that mean there must be a balun inside the box, and does it have some ratio other than 1:1 (i.e. 4:1, 6:1) if it is to match the 50 ohm input to a high impedance output like a long-wire. Or am I confusing the terms "long-wire" and "random-wire". Would a "long-wire" antenna be a balanced load if it is resonant on some band?

I really would like to know what kind of antenna and/or feedline I could use on this single-wire port for transmitting. Is there a 50 ohm ladder-line that would be a match if I connect the other wire to the ground? Please help!

>(i.e. 4:1, 6:1) if it is to match the 50 ohm input to a high impedance
>output like a long-wire.

Based on what I see in the manual, it appears to me that the
random/long-wire attached to ANT4 is simply being driven against your
station ground. It's an unbalanced feed, just like the other three
ports.

It really seems to be intended for just what they say - receiving -
where the impedance mismatch between the wire and the rig/tuner isn't
all that important.

> Or am I confusing the terms "long-wire" and
>"random-wire". Would a "long-wire" antenna be a balanced load if it is
>resonant on some band?

No... at least, not in this case. Even if it's resonant, you're still
feeding it in an unbalanced fashion against ground (a "Marconi"
antenna).

>I really would like to know what kind of antenna and/or feedline I
>could use on this single-wire port for transmitting.

A vertical wire cut to approximately 1/4 wavelength, plus a
counterpoise wire cut to approximately the same length and attached to

the tuner's ground, could give you an impedance in the necessary range. However, you may run into various "RF in the shack" problems.

The AT-150 doesn't appear to have a very large matching range... it's similar to the internal autotuners build into many of today's HF transceivers. It's suitable for adjusting the feedpoint impedance of resonant and near-resonant dipoles and etc., in order to allow your transmitter to operate into its design impedance and deliver full power. It doesn't really have a wide enough matching range to be useful for a broader range of antenna types (e.g. random-length dipoles fed via balanced feedline, random wires, etc.).

Bill, I'm not reading any motives. I'm simply responding to your approach. It's a bit harsh.

As others have pointed out, there are plenty of clipped wings grounded out just as you describe.

Also, as others have said: We're getting nowhere fast, this is the wrong group for that, and 'tis ok to agree to disagree.

However; I will concede a bit and say you can feel good knowing that if this were the *last* B-17, I'd probably lean your way too. But it isn't the last, and there's plenty of preserves.

What we have come to is quite simple; to collect or not to collect.... that is the question.

The answer of course, is equally simple:

All hail the great and powerful.....*owner*.

Personal prefs aren't much for debating.... so I shall bow out.
regards,
Woody

It does seem kind of pointless (accept for SW receiving) to have a
long-wire antenna port on a ham-band tuner. Is there any reason I
could not just wire in a short length of co-ax with a female UHF
connector (center to antenna #4 and braid to ground, of course) or
mount and wire in another S0-239 connector and have 4 working
unbalanced co-ax feed lines coming out of the shack? Minimizing
unshielded feedlines minimizes stray RF problems, right?

So what was ICOM's thinking in designing this port the way they did,
including front-panel push-button actuation, when all the other ports
are automatically selected by band? What would be the best way to take
advantage of this scheme setting in up my transmitting antennas?

1362. tower/transmitter ownership in the US

Newsgroup: rec.radio.amateur.equipment
Date: 2006-03-30 17:47:22 UTC
From: DrJoe <phdjwg@earthlink.net>
Message-ID: <1143740841.995202.114150@e56g2000cwe.googlegroups.com>
Source record: 10348

Hello all,

I am new to the group but have a specific reason for joining. The primary reason I joined, like many of you I am sure, is to get information about short wave radio. My situation: I have the appropriate parcel of land (110) acres that is free from any legal impediments to building a short wave radio tower. The land is located in West Central Alabama, in rural Fayette County.I also have the necessary funding to build a short wave radio tower and transmitter. The site has been evaluated as a perfect location that is virtually free from any potential liability and from the perspective of reaching millions of people in Mexico and Central America.

Questions for the group:

1. What are the potential financial rewards for owning and operating a short wave radio transmitter/tower?

2. How does an owner go about establishing a revenue stream from potential purchasers of air time.

3. Who would the primary customer base be?

Comments or suggestions?

Thank you,

DrJoe (newbie)

You are in the wrong newsgroup. FCC regulations prohibit any commercial
use of amateur radio frequencies.

> Comments or suggestions?

Perhaps you should try a more appropriate newsgroup.

Tedd,
Your right, it is a 12 pin female plug. I guess at 85 I have
trouble seeing or counting. The recptacles are so old they
have lost all their springiness. I tried deoxit on em and they
would work for a while, then I'd try to pinch them back together
and again within weeks one or several would'nt make good contacts.
And I dont think there is a 12 pin mike plug available this side
of heaven. Good luck on your sale I am sure someone will get a
good deal from you.

I've got a Butternut vertical HF6V and have plans to place it up on the roof. I've had it ground mounted (worked super) but due to family uses for the yard will have to move it up and out of the way.

Rather than laying down 20 pieces of wire on my roof for radials (insulated with the tips protected) I'd like to try and build a Butternut "No radials required with the optional CPK Counterpoise kit" but I'm having difficulty finding the specs.

Has anyone ever built one or have the measurements for a general purpose counterpoise kit?

Thanks.

Just run the radials... it will take around 550ft of wire.... I have my 5BTV
on the roof with 20 radials... the 75 meter radials are guyed out to trees.
It works very much good. :-)

"DrJoe" wrote ...
> I am new to the group but have a specific reason for
> joining. The primary reason I joined, like many of you
> I am sure, is to get information about short wave radio.

This newsgroup is not really about SW broadasting (or
listening). It is about amateur ("ham") two-way radio
communications which uses different radio bands than
SW broadcasting (by international agreement). Hams
in the US (and likely most countries) are specifically
prohibited from "broadcasting".

> My situation: I have the appropriate parcel of land (110)
> acres that is free from any legal impediments to building a
> short wave radio tower.

There are many more impediments than legal. It is
getting increasingly difficult for anyone to site broadcast
transmitters *anywhere* because of various factions like
environmentalists, people who are freaked about electro-
magnetic fields, etc. etc. And then there is the FAA to
deal with since your tower(s) will likely be >200ft tall,
not to mention FCC licensing etc.

> The land is located in West Central Alabama, in rural
> Fayette County. I also have the necessary funding to
> build a short wave radio tower and transmitter.

> The site has been evaluated as a perfect location that is
> virtually free from any potential liability and from the
> perspective of reaching millions of people in Mexico
> and Central America.

Evaluated by whom? There are consultants who specialize
in broadcast (AM, FM, TV) transmitter facilities. The
number of them who do SW is likely much smaller, I
would think. The consulting broadcast engineers with
SW experience is likely a pretty small community who
likely know each other. If your evaluation was from
someone who specializes in SW broadcasting, that
would be the logical person to start with.

But without knowing anything about the business, I
would be very afraid of being fast-talked by someone
who had only their own interests in mind.

> Questions for the group:
>
> 1. What are the potential financial rewards for owning
> and operating a short wave radio transmitter/tower?

No offense, but if you have to ask that question, you seem already in way over your head. SW broadcasting is an extremely "niche" market and you can likely count the number of SW broadcasters in the USA on the fingers of your hands. It seems extremely doubtful that ANY of the current commercial (non-government) SW broadcasters in the US went into the business for the money. A fast-food franchise would be an infinitely more logical investment.

> 2. How does an owner go about establishing a revenue
> stream from potential purchasers of air time.

Much like any other business. You work in the industry for several years and "learn the ropes". Or you partner with someone with that experience. This seems like a dubious investment if you don't even know if there is any demand for your airtime.

> 3. Who would the primary customer base be?

Do you do any SW listening? Do you know who the customers are on your competition? If you don't know the answers to these questions you have a great deal of homework to do. Keep your money in a CD until you can pull it all together.

> Comments or suggestions?

There are likely NO broadcasters, AM, FM, TV, or SW who do their own engineering (siting, towers, legal, licensing, transmitters, feedline, studios, operations, etc. etc. etc.) These kinds of specialties are virtually always contracted to a broadcast engineering consultant, likely several of them who are each specialists in their particular area.

The business side is also very specialized. Particularly for SW broadcasting for which there seems to be minimal demand in the continental US. (Based on the miniscule number of broadcasters out there.) I suspect that the majority of SW broadcasting from North America (or owned by US entities) is likely non-profit religious.

Google returned 1.18 million hits for this query: shortwave broadcasting in north america

The majority of them seem to be about SW listening,
but there may be someting about broadcasting in there
somewhere, also.

1379. Yaesu FT-107 question

I just acquired an FT-107m and I have a question.

The display is useless. On power up, it will show different characters
and not change at all while the frequency is changing.
The mode LEDs change when different modes are selected.

Is this the chip problem I've seen kits for or is it something else on
the counter board?

Where is the best place to acquire the modification?

Any thing else I should look for?

Cheers

Tone board? Most radios made in the past 10 or 15 years have tone
built-in. I don't think you can buy a new one today that doesn't.

My suggestion if you want a used radio is to look on e-bay, or get to a
local hamfest.

Posting again due to change in photo status...

I've already had 4 requests for pics, and I don't want to spend the day sending pics so I've put the pics on a free hosting site for everyone to see. Feel free to take a look - I feel the radio is in great shape.

Any questions let me know - it played when I got it about 2 - 2 1/2 years ago and has been sitting in the closet ever since. I've been advised not to power it up again without a variac (which I don't have) so all I can say is it worked when it was put up for storage.

Have a great weekend - let me know what you have to trade, looking for solid state or hybrid ham transceiver, quality short wave radio, trunk tracking scanners, or ??? I'm just not into boatanchors.

Thanks.

John

Hi Dr. Joe,

I have had some professional experience with a bit of this in my
former capacity with the US Dept of Defense. In the case I was
involved with, we had a great deal of effort keeping a short wave
broadcaster OFF the air in some specific frequencies because of
interference with an operation we were involved in. This wouldn't
affect you, but in the process I had to do some research and we
had some involvement with the FCC who we mainly worked with
to kill the proposed broadcasting service in the HF Short Wave area
or to put it somewhere else. AFAIK, it was never resusitated

Virtually none. There seem to be two groups broadcasting on HF SW.
There are a few religious broadcasters such as HCJB from Quito
Equador. I don't really remember any broadcasting directly from the
US. The other group is propaganda from governments for consumption
overseas. This would include the Voice of America which is forbidden
by charter to direct programming to the US (although many short wave
listeners in the US listen to it), the overseas service of the BBC,
Radio Moscow and the like. Many countries, even smaller ones will
broadcast their propaganda or the news as they see it and the main
audience is the intelligence services of other countries who pick it
up and forward it to intelligence agecies. The CIA has , for example,

the Foreign Broadcast Information Service doing this. This is not a covert operation, in fact quite open. The listen to the broadcasts, transscribe and translate what they here into English reports and forward them to other US Government Agencies who may have in interest in what is being said. The Intelligence Services will listen to it with a view to seeing if a foreign government is publicly saying what the intelligence services have picked up by other methods. Its just another source of information for them. The community of short wave listeners is actually quite small and for the most part are little interested in any commercial applications. While we hams all have short wave radios, many of which are capable of hearing these broadcasts, we probably do very little of this after perhaps an initial exposure. As a kid, before I became a ham (in the 1950's) I used to listen to some of this, but soon tired of it.
>
>
>2. How does an owner go about establishing a revenue stream from
>potential purchasers of air time.

Probably this is not terribly practical because of lack of common interests. There are better ways to sell stuff internationally or to advertise it, notably the internet and ebay. There are a few highly specialized services such as the British shipping weather reports which generate some revenue, but most of that is now done today by UHF and SHF satellite telephone systems. Some very large corporations like RCA maintain international HF messaging services, but the HF portion of that is dying as satellite takes over.
>
>
>3. Who would the primary customer base be?

Well a lot of people could potentially listen to it, but the reality is that there is a small community of hobbyist short wave listeners. They could hardly be considered customers because they are seldom in a position to buy anything that they hear about on Shortwave HF radio. The religious broadcasters do have a small base in HF, but the stuff being bought and sold (your soul for example) is a commodity which usually doesn't involve revenue. There are some which might solicit contributions from listeners to keep the service going but that is usually a zero sum game or less. The religious broadcasters depend upon contributors to whom operation of such a station is considered important, but mostly it is a non-profit venture.
>
>
>Comments or suggestions?

HF broadcast is a dying mode. There are better ways and more appropriate frequencies to reach audiences and advertising sponsors. Because of radio propagation vageries, it is really a poor means to broadcasting for one would have to know (and be licensed for) many variables. For instance a certain frequency could be useful at night

for a path to an intended recipient, and totally useless by day; or, vice versa.

It would strike me that the mere possession of some land would be a poor rational for starting any broadcasting venture.

I was under the impression that the opposite it true; that shortwave
listening, particularly in Europe, is very active. Curious to know what
W3JT based his comments on? Perhaps Im behind times and the internet
has taken it's toll on SWL along with other systems including ham
radio. Thanks.

> I've been advised not to power it up

Good advice. Let the new owner risk frying the power transformer if he wants to fire it up before replacing the capacitors (see http://antiqueradio.org/halli12.htm).

At a glance, looks like it's in reasonable condition. Nitpick: missing a piece from the clutch (brake?) assembly for the main tuner in front, but aren't they all? I have two SX-28's. One is missing those parts, the other one has them.

Regards,

Phil Nelson

1387. New program. Coils and Transmission Lines.

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-02 04:18:26 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <-cudnaDHSKoizbLZRVnyrA@bt.com>
Source record: 10373

NOW AVAILABLE ** New Program "TRANCO_1.exe"

This program analyses performance as a transmission line, of a
single-layer solenoid coil which may be inserted in an antenna wire.
The coil itself may be used as a very short vertical antenna at its
1/4-wave resonant frequency.

From the input data of length, diameter and number of turns, the
program calculates inductance, capacitance and resistance of the
equivalent transmission line. The secondary constants of
characteristic impedance Zo, phase shift, velocity factor, and
attenuation are calculated. Also the feedpoint input impedance, R+jX,
for when a coil is used as an antenna.

Because of the sensitivity to the environment of such an antenna and
its high Q it will be necessary to trim antenna length to a particular
wanted resonant frequency.

Download TRANCO_1 in a few seconds from website below and run
immediately. Filesize = 38 Kbytes. (It's at the bottom of the list.)

Averatec 5400 Athlon 64 1.6 2800+ 512 DVD Burner Win XP Laptop
It has a AMD Athlon 64 XP-M 2800+ processor 1.6Ghz 40gb hard drive
512mb of ram
15 inch LCD with no dead pixels
a DVD-RW / CD-RW burner
Lithium ion battery
a second monitor port
4 USB 2.0 ports
a PC Card slot
a 56K modem built in
10/100mbps wired ethernet nic built in
the Windows XP home restore disks
a LiteOn 115 ac power supply
It needs to be taken apart and have some heat grease put between the
processor and heatsink. When it gets hot it shuts off, checked AMD Processor
forums common problem they didn't put any grease on the processor. This
would make someone who is into laptops a good one. make me an offer loot or
trade what do you have? I figure value to be 4 to 500 bucks. There are some
on ebay listed for over 700.00
Thanks for looking.

It's probably too late by now to do this, but if you have good line-of-sight over the surrounding countryside, you'd probably make more revenue by leasing tower space and floor space in an building close to the tower to commercial radio or telephone cell site interests.

oh please, AMD is every bit as fast as an Intel (of the same type of course) and not a rip off.
Intel is way overpriced, but if you like the "so-called" brand name, be my guest.

I have several machines that I have built with both processors.

#1 Intel chipsets suck. No overclock-ability at all. What is Intel scared of?

#2 All the AMD machines I have built have out performed the Intels at the same rating.

#3 Throwing clock speed at a product is not the answer. Intel just recently learned this. AMD was the teacher.

1405. Car and Deep Cycle Battery FAQ

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-03 10:58:54 UTC
From: Bill Darden <info@batteryfaq.org>
Message-ID: <ruv132901qsd4e14rsif5qa5gr08g4mbcu@4ax.com>
Source record: 10391

Hi all,

The Car and Deep Cycle Battery FAQ has been updated. The current version is 5.4, dated April 1, 2006 and can be found on www.batteryfaq.org. Answers to Frequently Asked Questions, tips, manufacturer's information, references and hyperlinks are contained on this free, consumer oriented Web site about car, motorcycle, power sports, truck, boat, marine, recreational vehicle, solar, and other starting and deep cycle applications.

The most popular sections in February were:

Battery Manufacturers and Brand Names List

FAQ Section 9 HOW DO I CHARGE (OR EQUALIZE) MY BATTERY?

Section 7 WHAT DO I LOOK FOR IN BUYING A NEW BATTERY?

Battery Information Links List

Section 4 HOW DO I TEST A BATTERY?

If you have time, please visit www.batteryfaq.org. If not please bookmark it for future reference. Questions, comments and suggestions for improvement are always welcome at info@batteryfaq.org.

Many thanks and kindest regards,

BiLL.....

It seems rather inauspicious to have the document date so
prominently displayed at the top of the document...
"April 1, 2006" Many people try to avoid having serious
documents dated on April Fools Day. :-)

One of the "great moments" of my life was watching a B-17 coming in to land at the local airport. I didn't know it was coming in,and the noise and profile when I figured out just what I was seeing was overwhelming. I'm richer for it, and so are all those who have the experience. I've seen a lot of historic planes and spacecraft in museums. They are very nice and all, but to see one actually working is orders of magnitude better an experience. Museums bear more than a passing semblance to funeral parlors. Interesting idea to store the B-17 in the desert - that is where the plane graveyards are.

I'm a machine man, and machines are made to be used IMO. I don't care if it is automobiles, trains, radios, or airplanes.

1409. IC-761 drift/chirpy rx signals when tuner presets are adjusted

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-03 22:46:06 UTC
From: asrick@gmail.com
Message-ID: <1144104366.908381.239150@g10g2000cwb.googlegroups.com>
Source record: 10395

I have a strange problem with my IC-761 that I purchased recently. Any help would be great:

I notice that once in a while CW signals will start to sound a little warbley, as if infected with a little AC hum. At first I assumed this was a characteristic of the TX signal on the other radio but soon discovered that if I play with the auto-tune switch it will go away. Further investigation has shown that if I have the tuner on and play with the preset control it can start or stop the problem. The issue seems to be with interference to the rx signal from the auto tuner. Can the auto tuner affect the synthesizer in this way?

Thanks,

Anthony

Hmmm, another 'museum' request. See 'em all the time.

So, who actually owns the aircraft? I mean when it is sold off who will get the money.

I have been approached by 'museums' for my BC-375, ART13s, 348s etc even my BC-610.

But in the end it was an individual or his kids who would finncially benefit in the end.

So where does the financial ownership of material donated utilmately end up?

Problems of this sort are often attributed to RF coming out of the
transmitter, and getting back into the microphone-audio circuit and
being detected. You can end up with a very nasty-sounding feedback-
like hash on your signal.

RF pickup might be through the microphone and its cable, or (I
believe) through the system power supply.

Any such problems suggest that you may have a significant amount of RF
voltage floating around in the shack/vehicle and on the radio chassis.
The causes can vary. If you're feeding a long-wire/random-wire
antenna and are bringing the wire into the shack, you're likely to
have these "RF in the shack" problems, and switching to a balanced
antenna fed by coax or a good balanced line might reduce or eliminate
the problems. If you're already using a coax or balanced feed, you
may want to check the condition of the antenna - something may have
come unplugged or have broken.

If you're operating HF-mobile, check all of your ground connections
between rig, chassis, and antenna. If a ground connection has come
loose or has corroded, you could be getting significant amounts of RF
current flow where you really don't want it.

You could try adding a few ferrite beads around the mic lead (just
before it connects to the rig) and to the +12 power supply line, but
this is sort of a band-aid and doesn't really address the cause of the
problem.

Since the problem has just started occurring recently, and you've been
using the rig for years, I'd guess that some wire or connection has
come loose or has corroded somewhere, and that a good check, clean,
and tightening may resolve the problem.

Generally its the VCO trimmer caps causing that raspy signal. Usually
shows up on CW first. The tuner is not connected to the synthesizer at
all.

I think its coincidence the tuner makes the signal raspy, warbled

I currently offer a service for Mobile Phone users in rural/remote areas, where I fit a Yagi antenna for people with poor reception problems. At the moment I use a Mobile Phone's signal strength reading (along with a map and compass) to locate the strongest signal from the nearest base station (the region where I work, there is only one service provider). Because these readings are a bit slow to respond, I would like to build/buy a simple signal strength meter to be a bit more accurate, when setting up these antenna's. I either need something with a meter or even simpler (and maybe better) headphones listening to the familiar signals sent out by these things, to find the strongest signal. Because I work in very remote areas normally, I am guessing that the base station signals, should not be that hard to distinguish from the normal mish mash of mobile phone signals. Would anybody be kind enough to supply me with a diagram or a web site etc, to help me on my way? PS 980Mhz.

1426. Factory pressed dvd movies, ps2, psp & xbox backups for sale !!!

Source record: 10313

After years of open-wire lines and wire antennas in trees, I'm going to coax-fed antennas on a tower.

One unit has the Johnson coupler, the other has a Drake W-4 coupler with it, for monitoring power/vswr. The Drake coupler needs to calibrated to the Johnson panel meter. I have not used either coupler or internal meters.

Manuals are on BAMA and other places.

I have pictures; the units have done their job well, and show the wear. One has the relay and rcvr jack, the other doesn't.

As is where is, not DOA but see coupler/meter warning above, $300 for either one, $575 for both, shipped to your conus doorstep when the check clears my bank.

1428. PSK-31 interface help needed for FT-817

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-05 11:14:40 UTC
From: Rick WA1RKT <reply.to.newsgroup@nospam.no>

Source record: 10314

I have a new Yaesu FT-817ND that I would like to use on PSK-31.

According to the manual, one should be able to just connect the radio to the sound card without the need for any interface boxes such as the Rigblaster or Nomic.

I have done this with my old Icom IC-735 and it worked pretty well up to about 10 watts of output, so one would think I should be able to get away with it running only 5 watts or less on the FT-817.

My question is, have any of you all done that with success?

As for connections, I must say that the FT-817ND manual is pretty bad at explaining how to hook it up.

On page 38 the manual discusses SSB-based AFSK and shows the radio connected to a TNC.

Then on page 39 under PSK-31, it says only to "Connect the FT-817ND to your computer's sound card or interface" without going into any detail on how to do tyat.

I can only assume that the connections for audio are the same as shown on page 38, but they don't say that explicitly.

The big question is, how is the PTT connected? Does that operate off of DCD or DTR on a serial port? If so, note that the voltage coming out of a serial port's handshake lines can be as much as +/- 15 volts and still be within the RS-232 spec. I find it hard to believe that +/- 15 volts on the PTT pin of the radio is OK.

Of course, if the VOX circuit is active and can hear the audio from the data connector's Data In pin, then VOX could be used to switch to transmit mode.

Do any of you know if VOX will work in PSK31 mode?

Thanks and 73...

Rick WA1RKT

1429. New program. Input Z of loaded line

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-05 13:26:35 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <9eednYsvEJRUWK7ZnZ2dnUVZ8tydnZ2d@bt.com>
Source record: 10315

NOW AVAILABLE ** New Program "INPUT_Z.exe"

This program calculates the often required input impedance, Z = R+jX,
of a coaxial transmission line when terminated with a load impedance
such as a radio antenna. It uses full classical transmission line
formulae and therefore avoids the errors inherent in the Smith Chart
at the lower radio frequencies.

Also calculated are line attenuation, reflection coefficient, angle of
reflection coefficient, SWR, power efficiency, and the line loss in
decibels in the presence of SWR.

Input data of frequency, line length, load resistance and load
reactance can be varied in small increments from the keyboard to allow
line behaviour to be observed. The diameter of the coaxial inner
conductor is also input, this being needed for calculating loss in the
line which affects input impedance.

Download program INPUT_Z (40 K-bytes) in a few seconds from website
below and run imediately.

>+/- 15 volts on the PTT pin of the radio is OK.

Typically, one uses the RTS (request to send) line of the serial port
for PTT purposes. This depends on your PSK31 software package.

Using an optocoupler, rather than connecting directly, is probably a
good idea. A lot of PCs these days use pseudo-RS232 voltages (either
+5 and ground, or +5 and -5) but it's probably best not to take
chances that your rig might object to higher voltages.

>Do any of you know if VOX will work in PSK31 mode?

If you're going into the MIC input, probably so.

If you're going into an auxiliary-audio input, it may not. On my
TS-2000, the auxiliary audio input doesn't support the VOX circuitry
and doesn't work with the software-based "activate PTT" command over
the RS-232 port - it only works with the auxiliary input's "PTT"
ground-to-transmit line.

It isn't that easy unfortunately. In all the digital systems the base transmit power level adjusts according to a power up/down request sent from the mobile, so if you don't have an active transmitter you may not hear anything on a low-use system. At 980 Mhz the provider is probably using CDMA? In that case you might be able to find a receiver capable of finding and following the pilot carrier, but this solution won't be simple, and it won't be cheap.

Stick with the compass / map approach.

1433. Matched pair of Amperex 3-500zg tubes, near NEW!

Mouser sent me a couple of catalogs, the last probably sometime last
year. When I received no more, I assumed that it was because I hadn't
ordered anything from them. Their catalog is on line, but they don't
have everything: I found stuff in the Newark Electronics catalog that
wasn't in Mouser's.

Then there's DigiKey as well.

FS: Drake TR-4CW/RIT
The TR-4CW/rit was one of the last off the line, serial no. 45311, and
has the hard-to-find 34-PNB noise blanker installed, which I've seen
go separately for $200. It is extremely clean, a conservative 9+.
Flawless front panel except for one 1/8" scratch below the RIT button.
Cabinet top is perfect. Both sides are perfect except for one very
small scratch on the left side. Chassis is clean, no corrosion, no
smoke deposits. No evidence of modification. Two extra crystals are
installed for full 10M coverage.
Price: 950.00 Plus Shipping

Its marketing 101.... *any* order or correspondence gets you on their
mailing list. Same thing with my customers.... I always gat a name, address,
and phone number immediately after "Hello". From then on out, for up to 5
years, they are in my database and get fliers, mailers, post cards, etc with
the special de-jour. One of the best tricks is to send out cards to *all* of
the folks in the data base with a discount coupon on renewal of their
service agreement. You say you don't have a service agreement?? , no
problem, we will give you the discount as an "introductory offer", when can
we schedule you for a complete heating/cooling system perfoemance
evaluation?

It works a whole lot better than folks think.... and you still got the catalog to look through for your next order :-)

And same with DigiKey. But I'm going to request that
they NOT send paper catalogs. They've got so much
stuff that they keep making the font smaller every year
to fit it all in there. (And/or maybe my eyes are getting
old! :-)
Actually it is never ALL in the hard-copy catalog.

That sounds like a local HVAC company that called me 35 times in one
week, insisting that I "Needed" their "Central air tune-up special" I
told them the fist 34 times that I didn't even have a window air
conditioner, let alone a central air system and not to call me and tie
up my business phone line again. The last time she called, I asked her
how many phone lines they had. The woman wanted to know why, so I told
her that if I got one more call that I was going to contact a lot of
people to have them make repeated calls about their services, then to
have them come out to give a price on a new central air system before
telling them they had changed their minds. She yelled that it was
harassment. I laughed and told her, "Now you know how I feel!", and
hung up. They never called me back.

Sorry you got caught in the telemarketing loop.... I only do mail-outs.... and even then at the most only once a month.... The only time I call is the the night before a scheduled appointment, and again when I am enroute. There used to be an HVAC company here that did the same telemarketing routine that you got... their agreements were'nt worth the paper they were written on, and they had done more damage to the folks systems than they repaired. I gained a lot of customers from them. FWIW, I have *never* done a "tune-up" special..... Thats a real good way to end up on Dateline, or 60 Minutes. :-)

You only have *ONE* DD214?? I have 4 of them... did 22 years in the US Coast Guard. I just hung around until it wasn't no fun no more :-)

I wasn't trying to imply you were that bad, it just reminded me of
some of the low lifes around here who change their business name more
often than they replace their trucks. I grew up in Ohio where MOST
trades people took a lot of pride in their work. I now live in Florida
and I have NEVER seen one good drywall job. My dad and step mom bought
a new home two years ago. The bastards sold them a heat pump, and
installed central air with heat strips but no heat pump, before they
disappeared.

I have a firm rule: I NEVER do business with any telemarketer.
Everyone in my subdivision got a letter for a realtor informing them
that their property had gone up 37,000 in the past year, and claiming to
have been in business for 25 years. I have access to the county's
property database, and not one home in the subdivision had gone up that
much, except one that was replaced after the hurricanes the year before.
Like most of the homes here, my property had gone up less than $2,000.
I checked out the "Realtor" to find that he didn't even have a listed

telephone the year before. I should have turned him over to the state
for fraud.

> You only have *ONE* DD214?? I have 4 of them... did 22 years in the US Coast
> Guard. I just hung around until it wasn't no fun no more :-)

I only did one tour in the US Army in the early '70s. They were
phasing out my MOS, and hiring civilians. I was offered a civil service
job at Ft Rucker, but I turned it down. My MOS was "TV Equipment
Repairman", which meant that I was a broadcast engineer for AFRTS. As
far as having fun, I nearly caused a riot at Ft Greely Alaska, when I
transmitted out station ID in color on a completely monochrome
facility. I couldn't let the base information officer get away with
telling me, and everyone else that it was impossible to use anything at
the station for color. To add insult to injury, I did it at 6:00 PM, at
the start of our live newscast to make sure that the maximum number of
people would see it before I hid the evidence. NEVER tell the engineer
what he can do! ;-)

The sig file is there to be in the face of a moron who has been
stalking me on line for some time, and a couple idiots who don't think
much of the US military, and veterans in general.

BTW, the quarterly memorial for Veterans who have died in marion
County Florida in the past quarter is this morning, but I'm not well
enough to attend.

From: "C. J. Clegg" <reply.to.newsgroup@nospam.no>
Message-ID: <sf7g32d0mn5s1qhcjcokrrmaajckpd46tm@4ax.com>
Source record: 10346

I'm looking for a dual-band amplifier for the 144 and 440 MHz bands
that will do both FM and SSB.

I'll be driving it with nominally 5 watts from an FT-817 and I'd like
to get at least 30 watts out.

The only dual-band amplifier I've been able to find is the Mirage
BD-35 but that one is FM (Class C) only.

Any suggestions?

1461. Re: IC-761 drift/chirpy rx signals when tuner presets are adjusted

My IC-765 had the same problem. I brought the radio to Icom & they fixed the problem at no charge. I believe this is a known problem with the wax(?) placed on top of the trimmer caps to hold them in place.

I was a mechanical engineer... we got to play with things that had moving
parts :-)
Someday I will have to write a book about all of the things we did....and
even some of the stuff we *didn't* get caught doing. LOL

Enlisted men are extremely sly and cunning, and bear considerable watching.

Well I finally got thru to a Supervisor at MOUSER and told them
I had been promised a catalog a year ago and the noone in Hawaii
had every heard about MOUSER and why did they promise me one and
then never send it. They profuxely appologized to me and
said I would be sent one right away and it weighed x lbs
(I forgot how many lbs). I also told them I dont want any catalogging
done via email.

I tested out of three years at Ft. Monmoth New Jersey's electronics school and was awarded my MOS as a civilian acquired skill while I was in basic training at Ft. Knox, Kentucky. That was the main reason I didn't re-enlist. I caught a lot of flak from people who didn't like that I was only in the service a couple months before I was doing the same work they were, without going to the military school. They got really pissed that I could take a quick look at defective equipment and fix it before they could dig out the manuals and their notebooks. I even repaired RADAR equipment for a couple weeks while they were short handed. The RADAR techs were highly pissed when I told them that I had read the manuals for a WWII surplus aircraft RADAR system while I was in high school, and that it wasn't that different from a TV set. Anyone remember the 15E RF tube and the 15R rectifier? Electronics has always been easy to me.

> Someday I will have to write a book about all of the things we did....and
> even some of the stuff we *didn't* get caught doing. LOL

The engineers at Ft Greely insisted that we didn't need any air conditioning at the TV station, then claimed that we didn't have enough power for the 208/240 single phase through the wall AC we had bought out of our budget. It was six feet from a 100 amp three phase breaker box that was used to power the control room and transmitters. I popped off the cover to find that some genius had only used one phase, leaving me 100 amps at 208 VAC available to run a 30 amp unit. They still refused to hook it up, so I called one of the enlisted men who worked in that section. He rummaged around a few abandoned buildings and brought me what I needed to hook it up myself. We cooled the TV studio by opening the back door in the winter time. the -40 degree air did a nice job cooling the set, till a bear tried to get in one night. :(

> Enlisted men are extremely sly and cunning, and bear considerable watching.
> -Army Officers Manual 1836

I worked in the "Weathervision" section at Ft Rucker Alabama, which included CATV, Educational TV, CARS Microwave and other assorted equipment. Our mission was to provide weather data to the control towers, flight ready rooms and classrooms where they taught the

helicopter pilots to fly. We also maintained the entertainment CATV systems on the base, in parts of the on base housing areas. Some idiot cut the cable feeding our day room and pulled it to his room in the barracks. I reported it to the civilian contractor, but three days later it was still out, so I borrowed one of our bucket trucks from my section and repaired it at lunch time. I was just finishing up when the guy showed up. He was rather upset, till he found out that i had not only repaired it, but I moved the drop to where the moron couldn't reach it where it ran from the pole to the roof of the three story brick building. Then he told me that he was the only tech that serviced the base, and that I could put a drop into my one man room on the second floor, as long as I hid it for inspections. He offered me the supplies, but I had enough used stuff in the truck to do the job. The following Monday afternoon I got back from my duty section to find that the wire had been pulled loose from the hook outside my window, and run into the CQ room of the other company. I told them that it was MY drop that they had stolen. I received an obscene gesture and a threat, so i smiled and left. A couple hours later when they turned their TV on, I got a really good grip on the wire from my second floor window and pulled, really hard. I heard a loud crash, and a lot of cursing. Then they were pounding on my door, demanding that I give it back, and pay to replace their TV. It never happened, and I had cable TV till the day I left for Alaska. ;-)

Thank you, and you as well. My mission to help local disabled Veterans is to repair and give away used computers to those who want, but can't afford a computer a used system that will let them do email and browse the web. The VA recently upgraded the computers that handle prescriptions, and those of us under the VA's care can refill their prescriptions online. http://www.myhealthevet.va.gov/

Speaking along those lines, I was an RO at a WW1 CCC camp in Fla
when I got a msg from Sig Corps at WUO Ft Benning asking me to
come up and sign up with them and they would put me to work
right away. No basic training, or boot camp. I grabbed it
as I knew I could handle the CW up to around 40WPM at the CCC's.
Only problem was I got paid $8 a month and $22 a month went direct
to my Mom. After started at WD Radio in Benning even as a PFC
I was drawing down about $80 a month in 1940. Reason WUO handled
not only the S.C. WD Radio traffic, but also handled all the
Western Union and Postal Telegrph stuff accross the counter
so both W.U. and Postal Tel paid us a commision on top of
our Military Pay. Never went to any S.C. School until about
1944 as we rotated back to the USA on our 85 points system
of overseas duty. They did'nt know what to do with all the
5 and 6 stripe NCO's that were being thrown back to USA,
So they sent us to Camp Crowder S.C. school and taught us
how to be technicians on wide band FM which was just coming
into existance.
Exited at Drew Field in FLA. just after VJ Day

When I was stationed on west coast WHECs, I tapped into the ships cable system so I had cable at my rack, and had a little 4 inch TV and little stereo tucked up in a trap door I cut in the the false overhead over my rack... it worked great :-)
On the same ship, we had 12 engineers that were licensed HAMs and the CO cot a bit miffed when he found out that the engineers could copy CW better than his radiomen could... it was pretty funny. LOL

I doubt that there is one "favored" model, but here's my $.02:

I keep a Midland SAME weather radio (model WR-300) at home. For travel, handheld scanners that cover police/EMS freqs as well as NOAA wather channels are useful if you're so inclined. Also several amateur radio handhelds (can only be used for transmitting if you're a licensed radio amateur) cover NOAA weather channels. FRS/GMRS walkie-talkies sometimes include weather channels as well.

BTW, if you're not already a license amateur radio operator (ham), consider getting your license. The Technician class (no Morse code knowledge required) can be obtained by successfully passing a written 35 question exam, and allows local communications via simples or using repeaters for more coverage. A very useful tool for survival situations when the grid goes down, and a fun hobby, too.

They don't work where I live. And over in VA (Harrisonburg to be exact),
they only work in spotty locations. IMO, a complete waste of money if you
live anywhere in the mountains.

Most scanners made in the past 30 years will receive the NWS
broadcasts, and the newer ones will alert on SAME broadcasts. I use
my BCD396T if necessary.

I have an Oregon Scientific WR196T (no longer made). Nice radio if
you don't need to use it on batteries; it would use less power if
it had vacuum tubes.

If possible, find one that will let you select not only by warning
area but also by warning type. I shut mine off permanently when I
was awakened twice in the early hours by a WATCH that was never
alerted when it first came out and I was awake. Nowadays you'd also
have to shut out the "amber alerts".

My main weather radios are:

1. Yaesu VX5R handheld transceiver (a basic amateur radio license required
if you're going to use it to talk as well as listen); and
2. Radio Shack Pro-95 scanner. This has an alert function that sounds an
alarm if a weather emergency is spotted in my area.

I have an Eton FR300.

xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

All-in-one self-powered radio

eton FR300
AM/FM Radio with NOAA, TV-VHF, Flashlight and Cell-Phone Charger

This all-in-one unit offers functionality and versatility that makes it
ideal for emergencies. The FR300 provides you with radio, light, and cell
phone battery life when you need it most. The Hand-Crank Power Generator
charges the internal rechargeable Ni-MH battery pack. With the NOAA weather
channels and TV-VHF channels, you can find weather forecasts or listen to TV
shows when you're away from the set. Available in: Orange, Red, Black, Blue,
Silver

xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

I kind of like it.

Guy

You need an ''All Hazards'' radio to really be covered. Old style 1
kHz tone radios are obsolete.

Any idea if the FR200 radio from Grundig receives NOAA weather
channels?

If so, does it do it well?

One of the Grundig or Kaito hand crank AM/FM/Shortwave radios. I've found the local all news station to be far more up to date on forecasted weather and at least equal to radio originated tornado warnings. And the voice over radio is far more pleasant than the annoying mechanical voice of the NWS broadcast.

That's why you get a state of the art NWR radio. It makes no sound
unless there's trounble.

It depends on where I am at the time.... both of my trucks have HF and dual band (VHF/UHF) HAM radios, as does the house. They all work, and there is usually at least one on almost all the time. If the sky looks nasty and/or there is threatening weather forcasted(I check the Weather Channel at least twice daily), I run the dual banders on scan with the local repeaters programmed in, and turn the HF to either the 40m or 75m severe weather net frequencies.

most of the weather radio specs say something like they only guarantee the
digital SAME code to be accurately decoded 90 percent of the time.
With that in mind i would use a non SAME weather alert radio as my fall back
survival radio. The one that alarms on anything.

I have found that the NWS broadcasts are MUCH more detailed with the information I need.

Most news stations have LOTS of talk and LITTLE information in my experience....when I turn my radio on in an emergency situation I want to hear information NOW to conserve power and time.

It's long been the rule that during a life-or-death emergency that any
person can use any frequency, any mode of transmission on any radio.
Transmitting for anything less than a life-or-death emergency is not legal.

1500. Smallest 2M/440 mobile rig??

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-11 16:26:15 UTC
From: WA2OLZ <daedalusnj@earthlink.net>
Message-ID: <1144772775.578597.275090@g10g2000cwb.googlegroups.com>
Source record: 10286

Looking for advice to find the smallest dual-band mobile rig with remote head capabiltiy. The size of the transceiver is unimportant; the size of the remote head is what it's all about.

I traded my SUV for a VW Passat and there's not a lot of room to mount anything! I've already swapped out the standard 2X-DIN radio for a single DIN and installed a scanner in the other half of the 2X-DIN space, so that's gone. I have my GPS and Blackberry holder mounted on ProClip mounts, so I'm really getting tight.

I'd really like to find the smallest possible remote head mobile rig as I'm not fond of HTs in a mobile environment.

Any help would be appreciated.

Tnx & 73,
Jack - WA2OLZ

I concur. 5 1/2 x 1 9/16 is the approximate W x H of the control head.

The original poster was looking for the smallest control head. Near as
I can tell from the specs, the TM-G707A's head is considerably smaller
than the FT-7800R's.

Unlike most of the remote head radios, the TM-G707 control head fits
into a "cavity" in the front planel of the main radio body, so its width
is considerably smaller than the main body. Reason I bought it go begin
with was the same reason as the original poster... I had a very tight
car (BMW 3 series) and I wanted minimum impact physically in a rather
tight console area.... I managed to make a custome bracket and did a
beautiful no-holes installation I was really proud of.

Currently, that same radio control head is now mounted inside the ash
tray cavity of my wife's new Toyota Highlander.

I assume you saw my reply to the "which WX radio" thread.

Any of the new ht's will have extended receive. Some even have
receivers that go all the way down to the broadcast band.

The best site I found for reviews is (by far) http://www.eham.net/.
Lot's of good quality reviews... A while ago I ended up getting a
Kenwood TH-F6 tri-bander based on the reviews. A little expensive, but
it seems like a good radio, but I really can't compare. It has a load
of features, that's for sure. I thought it would be good to have some
sort of alternate commmunication if there is an earthquake or some
other sort of disaster.

I tried a CB first, but there is *no one* using CB around here. I
thought there would be at least a few truckers or something.

I don't have a license or anything, so I've just used it to listen. I
should get a license and join up with one of the emergency
communications clubs or something, but never seem to get around to it.

Depending on your plans, you might want to get a scanner, instead.

North and south freeways in So Cal use Chan 15, east and west use Chan
17 or 19 for CB

North of Burbank..its 15 to hiway 46..changes to 17

Hiway 14 to Palmdale Lancaster..the commuters use 12

I use mine just about every day in your AO

Too bad that Tecsun (Grundig) won't put a weather band on one of their crank radios. I'd think that if you live in a place where you need split second weather warnings (like Tornado Alley) that a dedicated weather radio would be better. I have a Midland WR-100 that can supposedly run on batteries, but I'd think that it would eat them quite vigorously. I rarely use it anyway, because California just doesn't have the kind of nasty weather that requires anything more than the nightly TV news weather report. California has earthquakes and floods and fires, but since those aren't directly weather related a weather radio does little to help. I keep a cheap Rat Shack AM/FM portable by my bed for most stuff, and a Degen 1102 ready to evacuate with if I have to. Most of the hurricane evacuees didn't have portable radios at the ready, and that caused a lot of frustration. If you're evacuated and stuck in a HS gym or community center with a lot of other people, having a working portable radio could make you the one eyed man in the land of the blind.

Well, I got a Cougar bland one of those. Still with the instruction
booklet - which is all in Japanese.

Hmmm, now what I need to do is find me a Horizontal Japanese dictionary
& language tutor.

cheers

I'm asking because the OP said they wanted a 2m HT with extended receive, and in order to help him/her I wanted to know what they meant by "extended receive". There is a significant difference between a receiver that covers 144-174 Mhz (NB FM only) and one that covers from the AM broadcast band to 1.2Ghz.

However, since the OP apparently treats Usenet as a write-only medium I guess we won't be able to help them.

Yes and no. SWMBO and I have worked any number of emergency nets. Normally, participants ID and are called by call sign so, in those cases, yes. OTOH we would certainly respond to anyone in a true emergency where there was a valid threat to life or even property.

Good for you! A lot of hams and people who knew CW were needed in a
hurry, and the military knew that they had to get them where they were
needed as soon as possible, so they bypassed basic training and AIT
wherever possible.

I always enjoy hearing from other Veterans who served in the signal
corps or AFRTS/AFRN. Thank you for your service to our country.

One evening the DJ announced that the request line was open, and that
he would play any record in the library. When he refused to play my
request, I turned the AM BCB transmitter off. ;-)

> Enlisted men are extremely sly and cunning, and bear considerable
> watching.
> -Army Officers Manual 1836

Some officers were even worse than the enlisted. Two lieutenants at
Ft. Greely drew their M-16s from the Armory, signed a tactically
equipped jeep out of the motor pool and went rabbit hunting in "Buffalo
Drop Zone" which was a restricted area. One of them shot at a rabbit
but he hit the rock it was sitting on. The bullet ricocheted into the
Jeep, setting it on fire, and starting a full blown forest fire. I had
to go fight the fire, and as we were finishing I saw the two officers
sitting back to back in the bed of a pickup truck, surrounded by CID.
One of them was warning them not to move, because they would love to
shoot them for trying to escape. The last i heard, they were sentenced
to 20 years at Leavenworth.

Yeah, very few officers had ANY sense of humor. On the other hand,
some knew when to leave well enough alone. I only stood Monday morning
formation a couple times the whole year that i was in Alaska, and my
C.O. would apologize if he woke me up during Monday morning inspections,
then back quietly out of my room. ;-)

I wonder if mine's defective, then. Or maybe it's not set up correctly.
I really should read the instructions...

I've tried channels 1--40, and *rarely* hear anything. I heard one
conversation, once, several months ago. Last weekend I was in Exiter,
by Bakersfield, and got nothing, again. 1--40 were all dead as far as I
could tell.

1536. Re: Signal Strength Meter - Mobile Phones

The simple solution is to find an old scanner that is not blocked on
cell phone frequencies. Then you can either watch the signal strength
meter, or feed the meter signal into an audio-frequenct VCO.

Regards,
Ed

Since the range on CB, without hanging a lot of metal in the sky, is
only a few miles, what's going on even in the next town may not have
anything to do with where you are.

On the east coast, I can drive hundreds of miles on I-95 (the
equivalent of I-5 here) and hear nothing on CB unless the traffic jams
up. Then they come out of the woodwork.

1540. New program. COAX_VLF

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-13 04:46:31 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <H8WdnWW6vZdxSqDZnZ2dnUVZ8qudnZ2d@bt.com>
Source record: 10226

Now available: Program COAX_VLF

The behaviour of transmission lines at the lower frequencies is more
complex than it is at HF and above. The effects set in sooner at
higher frequencies on low impedance coaxial transmission lines. They
are affected more at higher frequencies than other types of line.

As frequency is reduced below several hundred KHz the impedance Zo
increases, its impedance angle becomes more negative, and the
propagation velocity decreases. Unusual things happen such as
reflection coefficients being greater than unity and the SWR being
greater at the input end of a line than it is at the load end.

At power and audio frequencies Zo can be an order of magnitude greater
than the nominal HF value, and the angle of Zo aproaches -45 degrees.

It is useful to be aware of the magnitude of such effects. With coax
they can be experienced in small ways at frequencies as high as 2 MHz
or more.

Download program COAX_VLF in a few seconds from website below and run
immediately. Filesize = 48 Kilo-bytes. It is both practical and
educational. Try to fathom out how reflection coefficients greater
than unity can arise.

Thanks. Didn't see his/her post in rec.radio.amateur.equpment on Easynews, my local ISP's server, or Google. I did find a response in misc.survivalism, a group to which I do not subscribe. Subsequently I've quit crossposting to groups to which I don't subscribe - which I should have done a while ago as a matter of netiquette.

I'd like that. Now that I think about it more, the weather channels all work fine, it's just that I very rarely pick up any conversations on chanels 1--40. So I'm assuming it receives fine. It would be good to try it out with another CB and see if I can pick them from the same room.

1544. FA: YAESU VX7R VX-7R TRIPLE BAND NICE! Many Extra's No Res!

YAESU VX7R VX-7R TRIPLE BAND NICE! Many Extra's No Res!

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=9712306609&rd=1&sspagename=STRK%3AMESE%3AIT&rd=1

YAESU VX7R VX-7R TRIPLE BAND NICE! Many Extra's (No Reserve!)

Up for auction is a very nice Yeasu VX-7R with many extras . What you see in the photos are what you will receive. I have just have not had the chance to use it. Everything works great! Good luck!

THE WORLD'S FIRST SUBMERSIBLE AMATEUR HAND-HELD

Protected against water ingress by a wide array of rubber gaskets and other weatherproofing techniques, the VX-7R is rated for 30 minutes of submersion at a depth of 3 feet (JIS-7), plus a tough magnesium body with rubber bumper pads, making it ideal for outdoor use. Plus you get Dual Receive, 50/144/430 MHz operation plus wide-band receive coverage, a full color status indicator Strobe, and an "Internet" key for quick access to the exciting new WIRES□ repeater-internet linking system.

Unmatched Weatherproofing

The VX-7R case, keypad, speaker, and connectorts are carefully sealed to protect the internal circuitry against water damage. And the optional CMP460A Speaker/Microphone, like the transceiver itself, is rated for 30 minutes of submersion at a depth of up to three feet. The VX-7R is available in both Silver (VX-7R) and Black (VX-7RB) versions.

50/144/430 MHz: 5 Watts of Power

Utilizing a reliable FET power amplifier circuit, the VX-7R provides a full 5 Watts of power output on the 50, 144, and 430 MHz Amateur bands, with bonus coverage of the 222 MHz band at 300 mW (USA version only). And for 6-meter AM enthusiasts, you also get 1 Watt of carrier power on the 50 MHz band. Four power levels may be selected, each offering its own degree of battery conservation.

Dual Receive

The VX-7R is capable of four modes of Dual Receive, including simultaneous reception of (1) two VHF frequencies; (2) two UHF frequencies; one VHF and one UHF frequency; or one "general coverage" frequency and one "Ham" frequency. And you can set up the VX-7R to reduce the audio level on the "Sub" band, if you like, when a call is received on the "Main" band.

The Most Memories Ever

Sporting the most memory capability of any Amateur transceiver, the VX-7R includes over 900 memory channels, yet access is simple and intuitive, thanks to the 8-character labeling capability. These memories include 450 "regular" memories, 10 "One-Touch" memories, 40 programmable band-edge-limit memories 12 "Home" channels, 10 Weather Band memories, 89 Shortwave Broadcast preset memories, 280 Marine channels, and 10 "Hyper" memories that store complete transceiver configuration data.

The Most Dazzling Display Ever

It sounds like an auto tuner having a hard time getting a match.

30 seconds is an awfully long time though.

I don't think it's that simple. CB isn't exactly the place to discuss
Master's theses, but I suppose it has a place.

but ... if you're serious about learning about radio, including some
very basic circuit theory and radio operations protocol, ham radio can
be rewarding on a scale not imagined around 27MHZ.

Don't replace that CB. Get a shortwave radio that picks up ham radio
and listen for a while. Google "ARRL" and find out if it seems like its
for you.

GEE, do you think I just got fished in?

so be it.

> Tnx
>
> G ..

hi sorry to hear about your troubles i guess it's a ft-480r?

it might be a bad relay or switchin the mike, even a bad mike cord try
pressing the call button does it still happen? then it's not the mike
or mike cable rulling out the simple stuff first

i am an original owner and my relays are still fast, it's way off
freq now so i have to send my in for repairs its prob pll or needs
recalabration

shoot some relay cleaner in them and see what hapens

if its not a relay then since it only keys on warmup you might have a
part bad or smthing

good luck sorry i can't offer better advice

it'sa great rig

yes - ft480-r

tnx - well managed to download the book from dk.mods .there is a fault/flow chart for no tx ... . the relay is top of the list but there looks like a input from the ppl - if its not locked then it wont go to tx .. now the rigs 700 hz off freq (LF) ... so may be needs the freq needs setting and all will be ok ..

I think both have there place. I use a mobile HF rig in my truck but I also have a CB as well. The HF serves one purpose as far as ham radio is concerned but when I want an update on road conditions the CB is the only option.

Study for your ham license because it is a great hobby but that doesn't mean you have to give up the CB.

My 2 cents worth!

1567. Need Dual Band (144/440) Amp, FM/SSB

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-16 18:35:56 UTC
From: Rick <reply.to.newsgroup@nospam.no>
Message-ID: <1e3542hrvoi6uqq55tt8nrrk0vtoc2ajvu@4ax.com>
Source record: 10153

Any suggestions for a dual-band (144 and 440) amplifier that takes 5 watts in and gives me a reasonable output (say, 25 watts or more)?

The Mirage BD-35 is the only dual band amp I can find but it's non-linear so it's good for FM only.

Thanks...

1568. Mobile IC-435 ???

I gave up on CB radios years ago, when I started servicing commercial two way radios. I preferred the 1749 foot tower with the 5 MW EIRP signal coming from the UHF TV station I engineered at. I just wish I had the time to ride the elevator to the 1200 foot level to watch a launch from the cape when the shuttles were being launched, instead of being at another transmitter site every time. :(

I may get the code free ticket, if I get to feel well enough to go take the test. I didn't even make the local hamfest this year. :(

The IC-435 is an old UHF transceiver. Why would you think there would be problems with a unit designed for mobile operation?

IC W32A, it contains enough memory to add all the 2 meter repeaters
and common simplex frequencies, and can monitor all the weather radio
stations, and, as a bonus, operates on 70 cm as well.

Don't forget to have a copy of your amateur radio license...
Buck

I found it interesting that just before Hurricane Katrina (well, two days before), the Radio Shack's, in New Orleans still had lots of stock of Grundig crank radios left. Now, I know there are more essential things, but when you're sitting in a shelter for four weeks, that Weather band/AM/FM/TV-audio/Cell phone charger/LED flashlight radio might come in handy.

It sounds more like the PLL, but it's a long long time since I looked in the guts of my 480 or 780. I think I have the actual service manual for it at home somewhere so I'll try and hunt it down tonight.

I've never had my 735 mobile, but I imagine it'd be best to have a
small lamp aimed at the tiny sliders & buttons in and around the
plastic hinge :-)

And if you have the original mike, you can use it to fine-tune the
frequency.

I have a like new condition Mosley Classic 33 HF Beam for sale. It the late model CL-33-M and currently sells for $650 from Mosley. It has great gain on 20, 15, and 10 meters. It has a 18 foot boom.This one
was up for a little over a year and looks brand new. It has been taken down and is partially disassembled. It would be very easy to put it back together again since all pieces are color coded. It also would fit into a
pickup truck for transportation. Original Manual included. The price is $285 picked up or I can deliever it
to the Belton Texas Hamfest. Or I can meet someone within 100 miles of Abilene, Texas.
I don't want to ship it.Thanks, Charlie Hugg, K5MBX

CB is the only way to communicate with others on the road with
any consistancy. Until truckers and others use another method,
giving out warnings and trying to communicate with someone
next to you driving down the road, CB will dominate. Saved
my ass once when a trucker warned of a bad road condition.

Greetings:

I have a very nice AEA 232 (not MBX) listed on Ebay. Includes some
items that are to be used with an old Commodore computers!

Please see it listed at:

http://search.ebay.com/_W0QQfgtpZ1QQfrppZ25QQsassZve3tjd

Thanks, Tedd, VE3TJD

Aha, that makes more sense.

No personal experience here, but I don't see any significant concerns
about mobile use performance or reliability in the reviews.

Back in '85 or so I considered buying a little Radio Shack CB HT because my highway time in travel had gone up so much, but after hearing channel 19 there in the store, I changed my mind. I never heard such filthy language even when I was in the service. I'm no prude for sure good buddy, but while the truckers and whoever were cussing, all I could think of was all the kids that must have had to hear that kind of language because their dad or motherwere enjoying reading the mail.

1597. Advice Solicited: Sound Cards for HF Digital Modes?

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-19 04:04:40 UTC
From: Brian <kelly@dvol.com>
Message-ID: <1145419480.221842.92700@u72g2000cwu.googlegroups.com>
Source record: 10190

I'm having a PC (Win 2k) put together which will be my dedicated ham station box for running contest and general purpose loggers, 2M packet spots and the sound card based digital modes like PSK-31, MFSK and RTTY. I have zero hands-on experience with any of these at this point so I'm looking for advice from those of you who have been there and done it.

The computer will have some relatively inexpensive "plenty fast enough" Athalon chip motherboard or another and a gig of RAM. My understanding is that the "sound cards" integrated into motherboards sometimes don't do very well when it comes to running PSK-31 et al. While cost matters I'm not at all adverse to buying a decent third party sound card like one of the Creative Labs boards. My question is given your expereince which audio board or boards would you recommend if you were in my shoes?

Thanks ~ Brian Kelly w3rv

From: Lee Smith <chnrfm@mts.net>
Message-ID: <ABs1g.734$ZV4.5@newsfe23.lga>
Source record: 10192

Hi Folks:

Need your input on this. I've almost convinced myself to buy a new Subaru Outback and want to use my FT-897 in it. As of yet, I have not made a choice of antenna system and a search on the net has come up with very little info.

Are you aware of any RFI issues with this car? Do you have any installation tips, or websites with suggestions as to best mobile installation practices?

As this is my first new car ever, the work will be done by professional 2 way radio installers, as I want this to look very good and my work generally looks like it was done with stone-age man's tools .. LOL

Thanks for taking the time help out.

If I was going to set up a Pc that way, I would use any of the Creative Labs Sound Blaster Live series. Any of the Live series will work. My all time favorite card is the older Awe 64 Gold, with it's phono line out jacks. You can get the Live series "5.1 Digital/ect" for next to nothing, they also made some OEM for DELL I believe that are just as good....

Sure you are (a prude) OM but its nothing to be ashamed of. Cursing is a sign of poor vocabulary. OTOH, I was brought up on "Sticks and stones my break my bones but words can never hurt me!" so I find the PC notion that "bad words" can somehow hurt anybody, including kids, a bit amusing.

I will diaagre or if you add to your remark simple using of the "foul"
word is not the sign of poor vocab but rather only having them at your
disposal, the problem with such language is that it is only used so
badly most

but current morals are starngely inconsisant on most everything

You may be ok with MB sound. Im using the sound off my P4PE/L MB and after I did the
calibration Ive 0 problems with it. If you definitly want on board you can find the Santa Cruz
fairly inexpensive and add it your self.

But I would say try the MB Sound first.

So you think its OK to teach kids filthy language? Should Sesame Street
start talking like Stern?

As for the "sticks and stones"....rubbish. In some locations when you
start directing expletives at a person, it can be considered a "Breach
of Peace" or possibly even Disorderly Conduct.

ARRL threw principle out the window when they caved in to the demands of the Lambda Amateur Radio Club (LARC). It was a sad day for me indeed when I opened my beloved QST magazine and there on the pages were photos of queers on a Tropical DXpedition, and in living color no less. The ARRL wanted us to embrace a sick perverted lifestyle and be one big happy family. To me, it was the spark that signaled the death of a once proud organization, and it turned liberal.

Now the queers have all but taken over, they're like the military wing of the Democratic party, and always in your face. It's not even safe to take your kids to Easter egg hunts anymore. I know you're all going to disagree with me, but a man touching and sucking on another man's cock and fucking his ass just ain't right. The ARRL promoted this, now look what happened to our radio groups.

Well, your refusing to properly identify yourself with a real name, ISP account, and Radio License casts doubt on the credibility of your post.

I did not know that the Democratic Party had a 'MILITARY WING'. Who is the commanding officer? What is the source of that officer's legal commission? [PS: I am Republican]

Finally, your prejudices are showing!!!

"Skirt Chaser": Monicker like that, and message above, suggests you are overcompensating for your own latent tendencies. Or perhaps you've been to close to your antenna while transmitting with a California Kilowatt.

"Our radio groups": What's your call, OM?

"Military wing of the Democratic party": You mean Hillary or who?

Phil, W7OX

When I was a young lad, my parents taught me that there are a couple of
things you *DON"T* do in public....
First and formost, is not to say or do anything that you wouldn't want
repeated in your church sanctuary on Sunday morning.
Second is to treat *everybody* else the same way you want to be treated.
Third is don't put yourself in a position where somebody has to do something
about it.
All pretty good rules to live by, and they all are equally applicable to
amateur radio, or *ANY* radio.

Just my thoughts

That will be the tricky part, I think. Have not yet solved the problem
with my 2003 CR-V .. but I'm still researching the issue (radio was
relatively easy .. an FT-857). So far antenna solutions have been
temporary in nature.

Phil:

Thanks for the link. I've had a very quick look at it and seems like a worthwhile read.

I'll spend a few more minutes on the site and see what I learn about the world of mobile operations.

Regards,
Lee

I have an 2005 Outback, I have a Yaesu FT-90 dual band mobile in it.
It only puts out 50 watts on 2 meters but I have not had any RFI
issue's with it. I used a thru the glass antenna, which doesnt help
you any. One problem with most of these newer vehicles is space, not
alot of continuous smooth surfaces in them. But we love the vehicle!

Alinco DJ-V5TH High Power Dual Band HT New in Box

I bought this radio from a dealer at a local hamfest at the end of February. I am always attracted to these new radios, especially small ones like this one. The problem is I never use them and they end up gathering dust in the closet. I have had this one out of the box exactly once to charge it, pressed the buttons and listened a few times and thats it. So I decided to sell it before it sits around for a few years. It is in absolutely perfect condition as new in the box as a unit can be.

Includes

* DJ-V5TH Radio
* Dual Band SMA Antenna
* High Power Battery
* AC Charger
* Belt Clip
* Lanyard
* Original Manual / Schematic
* Original Box / Packing

I have owned this radio for many years having bought it new. I had planned on installing it into my isuzu trooper but never actually managed to get around to it. It has had no more than three to four total hours of use, if that. I has mainly been sitting on a shelf waiting to be installed. It has never been installed in a car and the little use it has had was on the bench with a bench top supply. It is in excellent condition with everything except the original box.

Asking $150.00, reseanable offers considered, no trades.

I've had no problems with thru-the-glass antennas, other than not the best signals (and losing one in a rainstorm at high speed in Montana a few years back!).

Generally VHF/UHF antennas are pretty easy to mount. Its the HF antennas that are a bear, especially with newer vehicles. My CR-V, with its swing-out rear door (vs. lift gate) is a bear. I had antenna mounts on the rear door (not a great solution), but was rear-ended recently and now have a new door, sans antennas while I noodle on other solutions. Yakima rack on top is inviting (but the antennas would need folded over to get into garages (mine and parking).

I find it fascinating to see all the personal attacks against Skirt Chaser, but not one poster says his conclusions are wrong.

Reminds me of some years ago when Dan Quayle attacked Murphy Brown for portraying a decadent lifestyle. He got crap from all over the spectrum, but not one attacker said his conclusions were wrong either.

Food for thought.

Bill, W6WRT

Your comments indicate that have an unusual interest in the homosexual
lifestyle. By appearing to be virulently anti-homosexual you come
across as trying too hard to convince us that you are heterosexual.
Possibly you need to convince yourself first that you don't have
homosexual tendencies before trying so hard to convince others.

Really, it's ok if you are. Just accept yourself as you are and
everything will be fine - eventually.

well you facts are in error

I said his conclusions were wrong

The ARRL had no real choice in allowing LARC to advertise the cloesets
it had to a choice was a long and expensive legal battle that it would
likely lose

as to the rest I refarined from comenting on the posters obvious sexaul
issues becaus ethey were
A) obvious and
B) simple the run of a flase premises which by the GIGO meant they
rest was garbage

Skirt Chaser,

So convinced of your position, you didn't post with a real name. One thing we all can agree on: The ARRL did not hide its political position.

I want to go on record as embracing the ARRL's move, a reason that I just may join after all these years. I guess I first need to identify myself as "normal" heterosexual, although sexual identity ought not be relevant to one's standing or reputation in life.

The terms of conduct you use are appalling, homphobic imaginationl. How can youi pre-suppose what two consenting adults do privately? Do we pre-suppose what heterosexuals do? Of course not, realizing sexuality is unique.

The only act that is obviuos becomes so by the birth of children, otherwise sexuality is a private matter. And on what basis do you connect children with homosexuality, which abuses pale in comparison to heterosexual abuses with children.

A compelling example, by no means alone, is the recent spate of female teacher abuses of male minors. To draw the example further, the reality of this teacher abuse by no means speaks for female teachers in general, any more than homosexuality equates to abuse of children.

Your post, to me, seems so rife with homophobia and prejudice that you seem mentally unbalanced. Of course, I could be wrong and I could be the unbalanced one. In any case, I wish you well and hope you will begin to feel the integrity of your words suffcient that you identify your posts by real name and call.

Bob Sherin, W4ASX

a good set of reasoning if one thinks the ARRL tok it out of principle
instead calulation of the chances andcosts of a fight

Sir I would never suggest insulting oneself by your self "normal"

Hmmm ... somebody clearly failed to teach reading comprehension. But yes it is
OK for kids to learn words that may offend prudes like yourself so long as they
don't abuse them or neglect to learn a proper vocabulary. There is no evidence
that any word ever harmed anybody.

lying as normal "dr" death I see

but to answer your question the concention with rec.radio.cb is that
the origainl poster posits that ARRL is responible for the near
constand of Homosexaul bashing in Radio Newsgruops such CB and to
another poster in the read Shortwave for that matter.

that the explanation is Bull not with standing is a on topic thread to
extent it sparks a discussion of why do so many people in the Radio
NG's choose to make homosexauly based attacks

as to the real reason why the radios NG has gotten into the gay bash
state they have is someothing of mystery to me, since the ARRL
obviously lacks such power

1650. Skirt Chaser is right the ARRL is responsible for all the homosexual posts.

Brian,

The easiest way is to pick a card that has a line level output. Very
few have it. It simplifies a lot of interfacing issues.

Look for the Creative AudioPCI card. It uses the great ES-1371 or
ES-1373 chipset and has line level inputs and outputs. Cheap, too. In
test writeups I've seen it has low noise, distortion, etc.

For a cheap interface check out the Rascal from Buck Rogers, the
former packet radio column writer for 73 magazine. Cheap, simple and
works good.

73,
Jim

Brian,

My suggestion is to use the mother board sound card to get started. It will certainly be "good enough" to get your feet wet, but not much more than that. However, having a second, dedicated card has both technical and practical advantages. For instance, if you have any sound schemes selected in Windows, those sounds can get transmitted by accident, which is annoying, and technically illegal due to band usage allocations. If the board you use for ham work is not the default sound card, this doesn't happen.

You also need to change settings of the mixer board depending on what you are doing. The old line out is still there, but it usually is handled in software as a rear speaker output. So I use my mixer configured for 2 speakers normally, and for 4 when I am operating PSK31. I slide the F/B balance all the way to the back, in this case, or a little forward if I want to monitor the TX signal.

One of the better Creative boards will be fine, and I also use the Santa Cruz board someone else recommended. N4HY, who does DSP signal analysis professionally somewhere beyond the bleeding edge, did some tests, and found it was the best of the consumer boards for ham applications. At one point, there was a detailed comparison available, but it seems to have vanished.

http://lists.contesting.com/_rtty/2004-03/msg00348.html

They are out of production, but they turn up on eBay and other sites. If you get one, make certain you get the WIN2K drivers off the web site, as they were not on my setup CD.

Sometimes you get some RF into the mic audio and its almost always
because its being impressed on the mic audio shield. Open the
connector on the end of the mic cord and put a jumper between Pin 6
and 7. A piece of resistor lead tacked into place will do.

This brings to mic audio ground to a direct DC chassis ground and will
get rid of any RF generally on the mic audio. Thats about all I can
think of I have come across using the 735 mobile.

Hi folks,

I'm a long time SWL but don't know much practical stuff about Amateur Radio other than what I've learnt reading the Australian Foundation Licence Manual (which was pretty straightforward).

My semi-retired father has been interested in Amateur Radio for some time, but hesitant to take the plunge, so last year I bought him an Icom R75 receiver and big sloper antenna to whet his appetite. He has been using this set-up for a while now, and has gradually learnt how to

operate the Icom, but his grasp of radio theory, and of technology generally, is pretty poor. He passed the Australian Foundation Licence tests, but only just, and his grasp of such concepts as SSB is no more than "try pressing the button and see if it sounds any better". However, he is an eminently practical man, and will have no trouble constructing and erecting antennas etc. He has a large block of land in

a low noise country area, with a shed for a base station.

Now that he has his Foundation Licence, I'm looking at what transceiver

might be appropriate for him, and here is where I seek your suggestions. My criteria are as follows:
- New rather than second hand
- Ease of use essential
- Knobs and single-function buttons important
- Multi-function buttons not attractive
- Computer-style hierarchical menus a no-no
- Large and easy-to-read display useful
- Portability, compact size and battery operation not important
- HF essential, 2m useful but not essential
- Computer control of no benefit
- Advanced features (eg notch filters) which require more than a button press or knob twirl of little benefit

The Icom IC-718 has a similar physical front panel layout to the R75 which he is already used to, which is a slight advantage, but I'm open to your suggestions as to what transceivers I should be considering.

Thanks in advance,
Carson

I think you're going to have to look at a "full-size" rig rather than a compact one if you want a dedicated button for every function. AFAIK, all the small ones intended for mobile use have multiple functions assigned to most of the buttons, often with deeply nested menus.

You could look at the ads for the current full-size rigs, narrow down your list of possibles based on features and price, then look at reviews in the magazines and on eham.net.

I have an Icom IC-706MkIIG myself now, but that's a compact with nested menus. Some of my fellow club members are Icom enthusiasts, some are Kenwood enthusiasts (esp. for the TS-2000), and I know one who has had a bunch of different Yaesu models. I've had a couple of Yaesus too, but that was a long time ago.

I think the IC-718 would be a good choice. Also, you might look at the
Yaesu Ft-840.

IC-718 paired with the excellent AH-4 antenna tuner would be my choice.

best I can suggest is a used rig... easy to operate, easy to learn to use, and "HAM" bands only. Check on E-bay for a Kenwood TS-130S. Thats going to be about the best you can do, for what your looking for. For something a bit more current, maybe the TS-50S.

Having been taken by sellers on these Newsgroups a couple of times but have now learned how to do it. I would like to recommend that anyone that buys anything from an unknown seller on a Newsgroup to only pay via the United State Post Office "Cash (Collect)on Delivery". It only costs the buyer a few dollars but will for sure stop the dishonest sellers from taking advantage of an easy sell on a Newsgroup. Of course the exception to this rule is you know the person that you are buying from and know they are honest.

Thanks for reading,

1688. APRSPoint new version (3.2)

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-24 10:15:59 UTC
From: "hxc98@yahoo.com" <hxc98@yahoo.com>
Message-ID: <1145873759.031937.236260@y43g2000cwc.googlegroups.com>
Source record: 10124

This version has several improvements on interface and fixed a few problems raised by users, mainly

1. Connect TCP dialog now remembers all servers, ports and filter strings user enters,

2. Added support for auto GPS connection at startup,

3. Improved handling for station tracking and track line customization,

4. Fixed a bug in weather station data processing,

Newer APRS symbol set support is planned, once we have mappoint 2006 and know more about its API interface. Again, visit http://www.aprspoint.com for further details and download of the latest version. Thanks.

1692. Is there something wrong with my math?

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-25 01:11:51 UTC
From: Ken Bessler <kg0wx@NOSPAMyahoo.com>
Message-ID: <rHe3g.902$4H.637@dukeread03>
Source record: 10128

I purchased and built an Elecraft XG-2 tri-band signal generator to
go with my K2 and my TS-850SAT. The manual for the XG-2
gives (roughly) this procedure for MDS testing:

1) Turn off your AGC
2) Select CW mode with a narrow filter, if you have one.
3) Crank the AF/RF gain up to full
4) Setup a VRMS DVM hooked to your ext. speaker jack

Measure the background noise on the DVM then hook up the
XG2, set to the proper band and set to 1 microvolt (-107dbm)
and re measure the voltage on the DVM. The first reading is N
and the 2nd reading is S+N. Do the following math:

Divide Signal (Vrms) "XG2 on" by rec noise floor (XG2 "off") = R
(Log(R))(20)+107=MDS

With this procedure on 40m my K2 scored -136.3dbm but my TS-850SAT
scored -137.2dbm. Puzzled by the results, I Googled and found those were
typical numbers, although the Kenwood seemed a bit on the hot side.

OK - Here's where it get's interesting - today I bought a Telonic Berkeley
rotary step attenuator, model 8107s. Now this device can add 0-59db in 1 db
steps. The manufacturer claims 0.2db accuracy and 0.4db insertion loss up
to 2ghz (worst case). To hook up to the XG-2 I needed a BNC male/male
adapter and a BNC female/SMA male adapter. To hook up to the radios I used a
SMA male/SO-239 adapter, 7' of RG-8x coax feedine into a MFJ 815c swr bridge
then through 2 coax jumpers (2' ea) with a SO-239 barrel connecting them.
Yes, I know - not an ideal low loss connection for MDS testing. I'll try
that later....

Anyways, I figure I've got 3db of losses (40m) through all those
connections/meter/coaxes. The XG-2 is supposed to be VERY accurate as far as
output levels go. Never the less I'm fudging the numbers based on W3AB's
recent tests of a XG-2 on an HP 8562A spectrum analyzer which showed a real
world output of -106dbm +/- 0.5db.

Let's add it all up: -106dbm - 0.4db - 3db = -110dbm.

If that is accurate, I figured I'd be able to crank in 26db of attenuation
before I reached -136dbm and lost the signals (I'm not measuring now - I'm
listening with headphones for the tone).

I went to 26db and the tone was EASY to hear! I eventually found that I had
to crank in **46 db** of attenuation before I lost the signal!

That's -156dbm for MDS, guys..... So what did I do wrong?

I have gotten a few manuals from http://www.w7fg.com/index.html

http://www.w7fg.com/search.php?find=hw+12 is for the hw 12

I think the ones I got were reporoductions, but excellent detail as good as
new

Good luck

1705. Special Transistor deal

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-27 17:57:34 UTC
From: Brian Murrey <brian@iquest.net>
Message-ID: <iC74g.9838$sq5.9354@newsread2.news.atl.earthlink.net>
Source record: 10141

I just came into possession of several thousand brand new Motorola brand
PN2222A transistors in the TO-92 package. So I have them 100 for $7.00
including shipping in the USA. These are new (old stock), unused parts,
still
on the paper tape they were born with. The part is clearly labeled and is
genuine
Motorola goods.

Order Item: PN2222 - Motorola

Send your order payable to:

Brian Murrey
47 Grassy Drive
New Whiteland IN 46184

or

Paypal to orders@hamradparts.com

What about the buyer that refuses the package or postman cannot deliver it ,or buyer decides that he doesn`t want it ..Seller is stuck with 2 times the shipping to get it back..OR seller sends you a box of rocks COD ..Buyer pays post office gets nothing but rocks..I agree about checking out the seller ,making sure that he is reputable ,That always seems to work out good for me.. Yes, checking out the seller's reputation is always a good thing to
do. I tend to be somewhat more suspicious of potential buyers (or
sellers) who have "fluid" addresses - PO boxes, PMBs, "Suite" numbers
at locations which turn out to be Mailbox Etc. or similar storefronts.

There are a couple of other approaches which I've found worthwhile:

[1] Use an escrow-payment service - a trusted and reputable
third-party which receives and holds the money from the buyer, and
releases it to the seller only when the buyer has received and
inspected and OK'ed the goods (or has received the goods and
failed to either OK or reject them within a given amount of time).

[2] Payment-by-halves / risk sharing. Buyer sends half of the funds,
seller sends the goods, buyer inspects them and then sends the
remaining half of the funds.

It can also help to make it clear that you *will* file mail-fraud
charges against anyone who ships you a box of gravel.

1716. Eavesdropping Video Receives 5 Stars Review

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-28 15:40:34 UTC
From: ctaylor@pinpoint-productions.com
Message-ID: <1146238834.902547.180340@u72g2000cwu.googlegroups.com>
Source record: 10002

The newspapers and journals are full of information about warrantless wiretapping and eavesdropping. What many people do not realize is that the type of eavesdropping occurring for national security purposes is vastly different than the real world of eavesdropping and wiretapping utilized for industrial espionage, law enforcement and by your local private investigator or tech-guy that has crossed the line into illegal eavesdropping.

Now, the realistic world of eavesdropping has been thoroughly exposed in the new two-hour video called "The Red Balloon". Already recognized as the best Issue Awareness Video in 2005 at the international Aurora Awards and given a 5 Stars review in the March issue of Security Management, The Red Balloon presents the government and industry statistics about industrial espionage and eavesdropping, and how big this problem really is. It also reveals the different types of eavesdropping devices used with illegal wiretapping and eavesdropping and the novel techniques utilized by both professional and amateur eavesdroppers.

If you are curious about the eavesdropping industry then you simply must see the powerful informational video presented by one of the world's most recognized experts in the field. To learn more you can go to http://www.tscmvideo.com

>

If passing a Ham test was predicated upon correct spelling, he'd be a washout.
Not only can he not spell, but he cannot comprehend what he reads.

1737. Dual shaft knobs for HP P/S

Newsgroup: rec.radio.amateur.equipment
Date: 2006-04-30 19:13:29 UTC
From: Ed <Huckleberry_REMOVE_@bigvalley.net>
Message-ID: <Xns97B57C8436D64spectrumhogstarbandn@198.186.192.196>
Source record: 10023

Anyone know where I can find a pair of knobs (4 pieces) for the dual shaft voltage and current adjustments on my HP 6286A? The unit is out of production and it doesn't appear that HP/Agilent carry this part anymore. If I can't find a stock set of knobs, a non-HP substitute would suffice.

The ICOM IC-2100H is a mobile rig, not a hand-held.

I programmed a tone-encoded (receive and transmit tones) in the call
channel memory with no problems. Go into "Call Channel" mode with
the M/CALL switch, then to the VFO mode with the M/VFO switch, set
it up in the VFO mode first to make sure that it works, then save it
in "call channel" memory with the S.MW/MW switch.

Page 33 in the Instruction Manual gives very clear step-by-step
instructions.

If ICOM has another rig with the model number 2100, it meets the
requirements of Dr. Professor C.T. Yang of MIT who, when confronted
with naming two different things the same name, would say "This one
not equal to that one - I only did that to con-fuse you".

In a few months (maybe sooner) the 5 WPM Morse code requirement will be dropped for as a prerequisite for amateur radio licenses in the U.S. A long-overdue move IMHO, and one that might rejuvinate ham radio here in much the same way that it has done in other countries that have dropped the code.

Amateur Electronic Supply, http://www.aesham.com , has a nice
selection of keys, ranging in price from about $10.00 for a new Ameco
straight key, to more pricey high quality units.

For a beginning ham, I'd get a new cheap straight key rather than a
used overly fancy model you might find on EBay.

Good luck.

Actually, there are various sign languages, often corresponding to
national languages, and I've been told that although they tend to have
more in common than spoken languages, a person who can speak one can't
necessarily understand the others.

You are claiming that there are circumstances under which CW can be
understood but none of the newer digital modes can? Assuming, of
course, a skilled operator for CW and appropriate equipment for digital
modes. Or even software for both.

From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <I8KdnSh2msqQP8vZRVny2Q@bt.com>
Source record: 9949

Program SKYTRIG - SKYWAVE TRIGONOMETRY

With an input of elevation angle, layer height and critical frequency, the program calculates skywave path distance, groundpath distance, spreading (dispersion) loss, field strength from a 100 watt transmitter, and the MUF.

The program can be used for guidance on the low MUF's and the geometry of near vertical incidence radio paths over short distance groundpaths.

Elevation angle is NOT the angle at which an antenna radiates the strongest signal. It is the angle of the path taken by the radio wave between two places on the Earth's surface and is nothing to do with an antenna.

The program notes provide some elementary information on the heights and behaviour of the various ionospheric layers in sunlight and in darkness. Also on factors which affect received field strength such as operating frequency being greater than MUF.

Download in a few seconds program SKYTRIG from website below.
Filesize = 42 kilo-bytes. Run immediately. Or you can open/run it without downloading.

Suggest you don't make the enclosure too small for a matching box (tuner).
Any inductor too near metal , will affect the inductor's Q
A rule of thumb is to keep the inductor away from the enclosure not less
than 1 diameter(of the inductor)
For this reason I am constructing an antenna matching unit in a plywood
enclosure or perhaps MDF ,although I understand MDF is no longer used in
the USA,because in contains phenolic resin. Perhaps someone in the know
on this NG can confirm this.

Hi Frank,

It sounds like you are going to an extreme that will create as more problems than it solves.

There is very little Q change in an aircore inductor of typical form factors when it is brought near sheet metal unless that sheet metal is in the core axis within a core diameter or less. The reason for this is air does not saturate, and the magnetic flux simply moves to a better spot.

There are only two exceptions to the generally very small Q reduction by a coil being near metal. The first is when the inductor is operated very near self-resonance, at which point any stray capacitance can seriously affect coil Q. The second is when the metal totally encloses the inductor and is so close it reduces inductance a significant amount.

MFJ has that problem is some small tuners, where the end of a 2 or 3" diameter coil is mounted right up against the sheetmetal (nearly zero spacing) and the when the cover is installed the other end has metal a fraction of an inch away. Unloaded inductor Q drops about 45% from 220 to 120 in that tuner whe the full coil is being used, and it is an exceptionally bad layout. Had they stayed an inch or two away from the ends of the coil it would not be an issue.

When you place components in a "transparent" box, you now have significant new problems. You have no reliable groundplane. Wiring is

an issue. There also is no containment of fields, you have created a small antenna in the room.

Most of the problems in tuners are caused by the tuner not have enough capacitance or using an inductor with crappy Q to start with, not by the box. You have to work at it pretty hard to make a design where the box kills the Q, but it is easy to make a box that radiates harmful RF into the area around the tuner.

I have moved my junkbox surplus stuff to a new website.
http://www.hamradparts.com

1N4148 Diodes $3.00 for 100, $4.00 for 200
1N4001 - 1 Amp 50v General Purpose Rectifier Diodes - $3.00 for 50

33pf NPO Caps, SMT 0805, 50V - $3.00 for 100
150pf NPO Caps, SMT 0805, 50V - $3.00 for 100
220pf NPO Caps, SMT 0805, 50V - $3.00 for 100
390pf Caps, SMT 1206, 50V - $3.00 for 100
1500pf NPO Caps, SMT 0805, 50V - $3.00 for 100
3300pf Caps, SMT 0805, 25V - $3.00 for 100
.1uF Caps, SMT 0805, 50V - $3.00 for 100

SPECIAL SMT PACK - 50 of each listed value $9.00
350 total parts

2N3704 NPN TO92 - 20 for $2.00
2N2907 PNP TO92 Package - $4.00 for 50
2N3904 NPN TO92 Package - $4.00 for 50
2N2222 NPN TO18 (metal) Package - 5 for $1.00
MMBT4403 PNP SMT transistor - 50 for $4.00

SPECIAL: 100pcs PN2222A Motorola $7.00- FREE SHIPPING

2N2222 NPN TO92 Package - $4.00 for 50
The 2N2222 is a bulk transistor...meaning the part is not labeled.
They ship in a Zip Lock packet and the packet is clearly labeled.

2N3906 PNP TO92 Package - $4.00 for 50
The 2N3906 is a bulk transistor...meaning the part is not labeled.
They ship in a Zip Lock packet and the packet is clearly labeled.

IRF510 - MOSFET AMP TO220 - 4 for $5.00

Crystal Ladder Filters anyone?
3.575611 Mhz HC49 Crystals - 5 for $2.00
4.9152 Mhz HC49 Crystals - 10 for $3.00
9.830 Mhz Crystals (SS2 package) - 20 for $3.00
LM7805ACV 5v Positive Voltage Regulators (TO220) 5 for $2.00
LM386N-1 - Audio Amp 6 for $5.00

Sticky Back Rubber Feet for your projects, self adhesive - 8 to a strip - 2
Strips for $1.00

Panasonic Wall Warts - 12VDC, 500mA (center negative) $6.00 each
If you need center positiove, cut off the end and reverse it. I use these to

power my
rock mites, my TT2, and all of my homebrew test gear.

8pf NPO Ceramic 50 for $3.00
11pf NPO Ceramic 50 for $3.00
12pf NPO Ceramic 50 for $3.00
22pf Ceramic 50 for $3.00
470pf Ceramic 50 for $3.00
560pf Ceramic 50 for $3.00
.1 uF (104J) NPO Ceramic 50 for $3.00
.01uF (103K) Ceramic 50 for $3.00

SPECIAL PACK - 25 of each listed ceramic $10.00
200 parts total

Cash, check, paypal now accepted

Paypal to: orders@hamradparts.com

Add $3.00 shipping to any order under $50.00 unless you are ordering the
special Motorola PN2222 transistors.

OK. I wqas thinking of weak but undistorted signals - there seems to be
evidence that digital modes can get through when CW can't even be heard.
Audible but distorted signals, as you mention, are a different problem,
one that I wasn't thinking of. Sort of like those distorted letters you
have to decypher to gain access to restricted Yahoo groups, GoDaddy
domain information, and various other web sites - a machine can
certainly see them, but OCR isn't good enough to read them (neither am
I, sometimes).

Jack Hamilton
jfh@acm.org

Though in a state of society some must have greater
luxuries and comforts than others, yet all should have
the necessities of life; and if the poor cannot exist,
in vain may the rich look for happiness or prosperity.
The legistlature is never so well employed as when they
look to the interests of those who are at a distance
from them in the ranks of society. It is their duty
to do so; religion calls for it; humanity calls for it;

and if there are hearts who are not awake to either of
those feelings, their own interests would dictate it.

Anybody know if this amplifier will work properly with the newer solid
state rigs such as the Icom IC-706 or IC-735?

I know that some older linears don't present a very good load to the
newer solid state rigs so that the VSWR that the transceiver sees is
too high.

1781. Questions on Siltronix SLM-100 Linear Amplifier

Newsgroup: rec.radio.amateur.equipment

Source record: 9964

I have seen a Siltronix SLM-100 HF linear amplifier for sale,
specifications claim 3-30 MHz coverage and 100 watts output.

Google shows only limited information on this beast.

Do any of you know anything about this amplifier?

It's fairly obvious that it was targeted towards the CB market, and
some of the amplifiers that are targeted to that market don't produce
an output that'st very clean. Any of you know how clean an output
this SLM-100 should put out?

I'd like to get something I can use with my Yaesu FT-817.

I'm curious about what your opinions of the ARRL Handbook. In terms of technical content, such as theory, construction projects, etc., which years are generally regarded as the best of the modern (solid state) era, and which issue for the vacuum tube era?

I'm interested in hearing about specifically those issues with really useful construction projects in the areas of complete homebrew receivers and transmitters, test equipment for the bench and field use and articles about RF circuit design.

Thanks for your opinions.

Hello all,

I did read several messages on the internet about a too low TXaudio on
FM with a FT1000(D) also when you work with a desktopmike from Yaesu
like the MD100,the MD1C8 or MD200.
My FM-txaudio is also low but my FM-dev is full open.
The SSB txaudio is very good is i have no complaint about that.I did also
adjust VR8305 on the SWA unit but no succes.
Is there any mod for this or where i can adjust the FM-dev more except
the FM-devation topaccesscontrol from the FT1000 ?-- Kind regards,
Hans Pluijgers

I guess it depends on what you want to build. The latest issue is best
in the sense that you can still get all of the parts the construction
projects call for.

Many of the projects carry over from issue to issue -- it's hard to
single one out.

Your best bet may simply be to buy the CD version, and get one for
each decade going back as far as you want.

What's the purpose of ham radio, To have fun talking about rigs and weather, or to be able to communicate?

To be able to communicate when no one else can communicate and to advance radio knowledge & theory?

What does part 97 say about this? Why does the ARRL ignore it?

When CW is lost, new hams will be just like CB'ers and SWL's, or some other lower life form of radio hobbiest. You name it.

Looking for AM transmitters of the type used for broadcasting. Want something in the 500 to 2000 Watt range. Must be all solid state. Typical examples include: Harris SX-1A, Gates One, Armstrong 1000B, Omnitronix AM 1000A, etc.

I suspect the best place to find one may be at radio stations who are surplusing gear. Could use some advice on how to contact them.

Any ideas will be appreciated. Please reply online as my JGoogle email

address is no longer valid.

I should be able to keep this from getting to me, but sometimes I just feel like responding to the attempted intimidation by these elitists.

Mate, your key is only silent from the neck, up.

Due to dyslexia, I am unable to learn much Morse Code. I can consistently recognize about half of the alphabet and none of the numbers. Morse Code might as well be edoC esroM for all the good it will ever do me.

In spite of this, I manage to be a responsible member of the ham radio community and I'm damn proud of my service to RACES, to my club as its treasurer and to the county as a volunteer communicator. My UHF/VHF points in last year's Field Day exceeded the points of our HF stations combined. Lower life form, indeed! The nerve of you!

You may get down off your high horse (or should it be "High Morse"?) and apologize for all those jabs any old time it pleases you. I'll be here.

cw.h@m.bands (known to some as Silent Key) scribed...

> What's the purpose of ham radio, To have fun talking about rigs and
> weather, or to be able to communicate?

The Amateur Radio Service serves many purposes. Here's a relevant
quote from Part 97.

-=-=-=-=-=-=-=-

§97.1 Basis and purpose.

The rules and regulations in this Part are designed to provide an
amateur radio service having a fundamental purpose as expressed in the
following principles:

(a) Recognition and enhancement of the value of the amateur service to
the public as a voluntary noncommercial communication service,
particularly with respect to providing emergency communications.

(b) Continuation and extension of the amateur's proven ability to
contribute to the advancement of the radio art.

(c) Encouragement and improvement of the amateur service through rules
which provide for advancing skills in both the communications and
technical phases of the art.

(d) Expansion of the existing reservoir within the amateur radio service
of trained operators, technicians, and electronics experts.

(e) Continuation and extension of the amateur's unique ability to enhance
international goodwill.

-=-=-=-=-=-=-=-=-=-=-=-

I sure as heck don't see anything in there AGAINST talking about
"rigs and weather," or anything else within reason.

What I do see, in paragraph (c), is the use of the word
'advancing' together with 'communications and technical phases of the
art.'

That, to my eyes, says "value the past, but look to the future."
The simple truth is that, while CW remains a mode that would probably be
usable under nearly any conditions, it is no longer necessary as a

license requirement.

> To be able to communicate when no one else can communicate and to advance
> radio knowledge & theory?

Exactly. The advance of radio knowledge and theory over the past two or three decades has reduced CW's importance as an operating mode. It still has value, to be sure, but (again) I don't see any need to make it a license requirement.

> What does part 97 say about this? Why does the ARRL ignore it?

What evidence do you offer that they're ignoring anything?

> When CW is lost, new hams will be just like CB'ers and SWL's, or some
> other lower life form of radio hobbiest. You name it.

Well, then, I guess I'll be a "lower life form" in your eyes, because I haven't ever really had that much interest in CW as an operating mode. Too slow and frustrating for me, and I've not used it in over 20 years, since I got my first license (in 1977 -- look up WD6EOS in an old Callbook) and did exactly one CW QSO on the air. After that, I went over to voice and RTTY modes exclusively.

Others have been predicting the "Death of Ham Radio" for years. We heard it when the Internet came to be well known, we heard it when Echolink and IRLP started to catch on, and we're hearing it again with the potential elimination of Morse knowledge as a license requirement.

But you know what? The Amateur Radio Service is alive and well, at least in my part of the country. Lots of activity on HF AND the local repeaters, still a fair number of CW QSO's on the bands (this from tuning around just last week), and the local repeaters continued to work very well indeed after the Nisqually Quake of 2001. I know. I was here for it.

When the FCC writes to me, and tells me to turn in my license and cease operating because the Amateur Service is no more, THEN I will believe that it's dead.

Until then, let me say thank you for sharing your opinion with the group.

Here's one that I haven't even seen:

Not everyone speaks readable English, but anyone that knows Morse can copy
any language and read it at their leisure. Also, those who don't speak
English well can often spell the words well enough to read...

Just a thought.

Can anyone help me with research for my degree.

I'm looking for information on ham radio enthusiasts who suffer from manic depression (bipolar syndrome). I'm researching the effects of RF fields on electrical activity in the brain. It's possible that this particular form of mental illness could be specifically at risk.

Can you put me in contact with anyone who could help me?

Thanks

Gerry G.

In order to graduate school in the Navy we had to both read a punched
teletype tape and read morse code. I don't recall how fast the code was
but the test day was a bitch!

Mis-statements abound again.

Read the allocation chart in 47 CFR 97.305(a) and 47 CFR 97.305(c). What
CW sub-bands?

47 CFR 395(a) "An amateur station may transmit a CW emission on ANY
frequency authorized to the control operator." [EMPHASIS ADDED]

For USA Amateurs CW is authorized as stated above.

If you really believe that morse code is an important way to communicate that should be preserved then you need to convince other hams and potential hams to learn the code. You need to convince enough hams to use code so its very usage generates excitement and makes people want to join in the fun. Almost self-perpetuating like it was in the 1950's.

Preaching (or complaining) to the choir on the radio fora about the abysmal state of things will not add one person to the ranks of key pounding hams.

So what are you going to do to increase the number of code practicing hams.

CW will not be lost in the same way that AM is not lost.
A lot of hams in the 1950's believed that SSB would cause
the death of AM and ham radio along with it. SSB operators
sounded like Micky Mouse and were known as Single Sidewinders,
undesirable snakes in the grass within the hobby, and traitors
to the traditional form of amateur radio AM communications.

It is a shame that you are unable to enjoy this wonderful hobby. I look at it this way. I would have loved to be a great tenor, but I can't sing a note. As a child, I wanted very much to be an airline pilot, but I get sick as a dog in aircraft and boats. In high school, I would have given anything to be a football star, but I was too light and slow. We have to live with the cards we are dealt. Some get four aces, and some don't even get a pair. We just have to make the best of what we are given.

As an ARRL VE, I should point out that you do not have to know the code to get an amateur radio license. The test for technician is only 35 questions, and you can miss 9. That's only 70% you have to pass. You should be able to get 70% without worrying too much about pictures or diagrams. I suspect that you are not giving yourself enough credit. You stated your position with more clarity than most on these newsgroups. That tells me that your ability to think is pretty good. I believe that you would be able to pass the Techician test without any problem. Have you tried the practice tests on the Internet?

If you are in the US you do not need to look at any diagrams. Just get a
book that has the question and answers in it. Then memorise it. They are
the exect question and answers.
That will put you to the Tech license and the code may soon not be needed
for the low bands.

Well, "SC" a.k.a. troll,

Cw, when it came along, was frowned uopn and was predicted to be the death of ham radio as well. Did you know that?

Modes currently around that full knowledge of is NOT required to get a licence (where complete knowledge of sending and receiving all the characters in Morse is a requirement):
AM, SSB, RTTY, PSK, Paclet, Amtor, APRS, satellite...basically everything else in Amateur Radio!

I said *full* knowledge. Do any of the tests require explanations of all five (or is it ten) methods (circuit types and how they function) of generating SSB or how to generate CW...or proper operating practice in all situations?

Do you know WHY knowledge of Morse was required in the first place?

I think there should be more on the tests on operating practices. I know some Techs who can do much of the above and make better hams that any old fart crying over the supposed loss of CW. I know Extras who couldn't copy code worth a darn, nor do much in the way of tech stuff...so? They're all friends.

Your fingers and eyes (or ears) aren't broke... so why aren't you out mentoring new hams? In the last two years, how many programs have you written for helping hams with things like blind hams controlling rigs or or audio tapes on radio operation have you recorded for blind hams or trips to help a blind ham erect an antenna, do a small project or program his radio or cables you've given to a new ham for his antenna or taken a blind ham to a hamfest... Why am *I* wasting my time with this...pfffvt

I'll save you the trouble, I'm a 60 year old, 20 WPM Extra and currently spend most of my ham time on 2 & 440 from the car during drive time on repeaters (much more omitted)!

I didn't have to learn code in the Navy (though I did happen to already know it)

Jerks are everywhere and I wonder why I wasted this time. Guess I just needed a little vent...sorry folks..time for lunch.
73, Steve, K9DCI

Answers to the above questions for me: 5, 4,0,1,10,3,1 - not astounding, nor bragging, just true.
If you can't Walk the Walk, don't talk garbage.

Yep! I stand corrected!!
5330.5 KHz USB ONLY, Maximum band width 2.8 KHz. 50 watts ERPd max.
5346.5 KHz USB ONLY, Maximum band width 2.8 KHz. 50 watts ERPd max.
5366.5 KHz USB ONLY, Maximum band width 2.8 KHz. 50 watts ERPd max.
5371.5 KHz USB ONLY, Maximum band width 2.8 KHz. 50 watts ERPd max.
5403.5 KHz USB ONLY, Maximum band width 2.8 KHz. 50 watts ERPd max.

And, "I dare not call it a 'band'" either. Just 5 channels occupied by
gentle men and gentle women, both genders, with manners.

I have three rigs that operate '60' meters. I've gotten to love that
non-band.

I'm fearing it will be Eminent Domain ham radio style.

They'll see spectrum that they don't have the ability to use, because there will be no requirement to have that ability. They will want the spectrum for phone. One good thing, there are other modes besides CW that need it, so maybe they won't take our CW portions and give it to phone only hams and appliance operators.

Thank you.

In a way, it's sort of like sign-language. Two people that don't know
each others tongue but know sign language can still communicate.

Thank you for your service to America. It is people like you that make us
a great country. When hard work was needing to be done and learned you
were there.

Today people are lazy and that's why they want to get a license in as easy
a way as possible, even if it means the service and our ability to
communicate with each other suffers.

But it's the lower qualifications that will cause the service to suffer. I
don't think new general class hams today have as much of a grasp on theory
as new ones did 15 years ago. 15 years ago, they spent more time studying
the theory while they were building their code speed up.

Loss of the requirement to be code proficient though could be offset if
the passing score on written the exams were raised to 85%

Yes, but can you send and receive Code at 13 or 20wpm?

What if in an emergency your microphone broke, and the only thing you had
to save a life was CW? With your skills, that person would die. In that
situation you'd be about as useful as two tin cans and a piece of string.

Come on Bill, I know you care more about ham radio than to just post the
meter.

Right, that's the service nature of hams. Hams helping hams, and hams serving the community. And Dumbing it down can effect the quality of service. Maybe it won't go totally to shit while you and I are still around, but it will happen. In Life, What happens when standards are lowered, things get better?

why? the FCC has made up its mind just waiting fro the monemnt to enact
it with the least fuss

if you wanted to make a last find the CONGRES crtiter on the telcom
comittees but you need a reason to save sw testing first
the reason your side lost is they don't have areason that stands up for
imposing the restriction\

Actually your own words have proven that you can learn it. You say you can consistently recognize about half the alphabet. So you have demonstrated your ability to learn it.

Perhaps you just haven't spent enough time on it or used a poor training method (there's way too many of those around). Most people's expectations of how long it will take are unrealistically short. For the average person, it will take 1/2 hour per day every day for 60 days.

Now writing it down could be a problem due to dyslexia but there are ways around that. You don't have to write it down. You can ask to be allowed to say the characters into a tape recorder. You could dictate the characters to a VE to write down for you. You could simply jot down notes and answer

the questions and not worry about solid copy. Again if there is a risk of writing it backwards, you could have the VE write down what you tell him/her. Naturally such accomodations have to be set up in advance.

You are painting with a very broad brush. There are many amateurs who do not jab the Technicians. These days the membership of most clubs is about half Technicians. Perhaps you need to run with a different club.

but there are neough of them your self for example presumeing you know
what another person can do I am can keep about half the letter in my
head at a time but no more than and I spent many years at with little
success

you are judgemental and all but calle dhim a liar for saying he can't
do it

Well, with the 4 or 5 CW signals that are on most bands at any given
time (except VHF and up during contests, BTW), who would notice the
loss. No offense, but if CW ops want to keep the territory, they'd
better start populating it.

Yup, that increased the number of CW ops by a lot. Typical old style
ham response. Moron. Pure and simple moron.

This is why CW is losing the battle. Not because it's a lost art, or
something that's not worthwhile, but because the "supporters" do nothing
but complain.

I don't want to see CW go away; I think it's a "good thing", and should
stay around, especially for things it still does well, such as EME. Of
course this is not the place to speak of "advanced" things like EME,
after all, it's only been around for 50 years.

I love it too. It's a great mobile band, but I don't have a mobile
antenna for it. I have used it with a tuned dipole a good bit. Even
talked to England once. It is mostly stateside comms, but its like
you said, a lot of gentlemen and gentlewomen! I am hoping to get an
antenna for it in the near future for both the car and my new
location.

73 for now.

PS there is a sixth channel only available in and around Alaska, but I
forget the frequency. It is an emergency only channel.

Dumb argument.

CW is only being removed as a compulsory exam element. Oddly enough,
now that it is not compulsory, it's popularity is growing!

Which is most likely, actually. We broadcast a lot more voice than CW,
Ever noticed how many watts of television, FM radio and AM radio are
out there versus CW?

CW is effectivly dead except for those that wish to keep it alive.
Similar to the old car collectors. Nothing wrong with it. beautiful
collector items, but not really part of the current world.

The only one I know is a guy in the Orkneys. GM3POI - his name
is Clive Penna. Apparently he has a manic episode every nine
days regular as clockwork - and that's pretty bad from what
Ive been told. Broke up his marriage apparently.

I can't see him helping you with info though. He's not the type - but
then perhaps that's just another symptom.

Brian.

I bet no one from the antenna newsgroup bothers to respond because the topic doesn't have anything to do with antennas. There are plenty of other newsgroups for those who favor the endless CW/no CW arguments.

My $0.02: Passing the CW element requires the acquisition of a skill.
Passing the "written" element requires memorizing answers to a test where
the answers are handed out ahead of time. Some accomplishment, eh?

Thank you.

If I may add something to that...
I wouldn't like to see Morse totally disappear, but I'm against its
compulsion for trainees. I fully agree that in some conditions a Morse
tone will get through where voice is an unintelligble mush, if heard at
all, but apart from prisoners tapping out messages on pipes its days as
an *essential* comms tool are pretty much over.

We've all got to move with the times and these days Morse is on a par
with a runner carrying a message in a cleft stick. There will be some
who enjoy using it and I hope they find enough fellow enthusiasts of the
arcane art to keep themselves happy while the rest of us communicate
more naturally.

CW is just memorizing the sounds . That is not a skill. Yes, I do have the
20 wpm extra. Got up to speed, passed the test, never used it on the air.
I still listen to some about once a month just to see if I can still get any
of the characters.

A skill is more like repairing a piece of equipment or building something.
Maybe even the ability to put together an interisting conversation instead
of the usual WX and Signal reports.

I don't think it is as effectice on SSB. Of course, you can use the
symbols that were derived from CW (like QTH) but I think morse code is a
more direct communication in these circumstances because it doesn't
involve voice/pronunciation differences between languages. The symbols
are universal and immediately understood.

Phonetic usage (alpha bravo whiskey hotel etc) is primarily based upon
English.

I think we need to face the fact that ham radio, in general, is not as necessary or as "needed" as it was even 20 years ago.

It's a hobby. It remains a service but it is a hobby.

CW,SSB and any other mode you choose is not that much NEEDED.

CW being the simplest form, remains the form of choice when ALL infratructural resources are gone.

Memorizing a sound is no more of a skill than memorizing an answer. In any case. I can memorize sounds. I can't memorize answers. I have to know the subject to get the answer right. If people think that CW is of any importance, they will learn it whether the test requires it or not. Those who think that it will die if it is not required are just afraid that it really is useless.

But being able to pull up the correct characters from memory at the pace of an incoming stream is a skill.

I have an 85-year-old uncle who was a cw operator in the Pacific in WWII. He hasn't done anything with cw since 1946, and he can still copy around 10 wpm when I make him a bet.

I can go for several years without hearing cw and still step in and copy 15wpm easily.

Those of you who once passed 20 wpm tests and now find it a challenge to see if you "remember any of the characters" are simply not very bright.

It has a certain bandpass response curve. It also has an adjustable
clipper that you can set for various levels.

Thanks,
Tom

For either line-of-sight or multi-hop propagation through the
ionosphere -

- this apparently simple program computes path loss in dB between
transmitter and receiver, field strength at the receiving site, and
receiver S-meter readings. Transmitter power output can be varied
between 10 KW and 1 milliwatt.

It is educational for newcomers and of assistance to DX and
line-of-sight experimenters. It illustates how S-meters OUGHT to work.

Download program PROPGATE from website below in a few seconds and run
immediately. Its at the bottom of the list.

....

An interesting accessory designed and built by WRL for the Globe "Scout"
and "Hi-Bander" series.
